IOMUXC_SW_PAD_CTL_PAD_GPIO00 field descriptions

| Field | Description |
|-------------------|--|
| 31–17 Reserved | This read-only field is reserved and always has the value 0. |
| 16 HYS | Hysteresis Enable Field Select one of next values for pad: GPIO_0. 0 DISABLED — CMOS input 1 ENABLED — Schmitt trigger input |
| 15–14 PUS | Pull Up / Down Config. Field Select one of next values for pad: GPIO_0. 00 100K_OHM_PD — 100K Ohm Pull Down 01 47K_OHM_PU — 47K Ohm Pull Up 10 100K_OHM_PU — 100K Ohm Pull Up 11 22K_OHM_PU — 22K Ohm Pull Up |
| 13 PUE | Pull / Keep Select Field Select one of next values for pad: GPIO_0. 0 KEEP — Keeper Enabled 1 PULL — Pull Enabled |
| 12 PKE | Pull / Keep Enable Field Select one of next values for pad: GPIO_0. 0 DISABLED — Pull/Keeper Disabled 1 ENABLED — Pull/Keeper Enabled |
| 11 ODE | Open Drain Enable Field Enables open drain of the pin. |

Chapter 37

Image Processing Unit (IPU)

37.1 Overview

The IPU is planned to be a part of the video and graphics subsystem in an application processor.

The goal of the IPU is to provide comprehensive support for the flow of data from an image sensor and/or to a display device. This support covers all aspects of these activities:

- Connectivity to relevant devices - cameras, displays, graphics accelerators, TV encoders and decoders.
- Related image processing and manipulation: sensor image signal processing, display processing, image conversions, etc.
- Synchronization and control capabilities (to avoid tearing artifacts).

This integrative approach leads to several significant advantages:

- Automation: The involvement of the ARM platform in image management is minimized. In particular, display refresh/update and a camera preview (displaying the input from an image sensor) can be performed completely autonomously. The resulting benefits are reducing the overhead due to SW-HW synchronization, freeing the ARM platform to perform other tasks and reduced power consumption (when the ARM core is idle and can be powered down).
- Optimal data path: Access to system memory is minimized. In particular, significant processing can be performed on-the-fly while receiving data from an image sensor and/or sending data to a display. System memory is used essentially only when a change in pixel order or frame rate is needed. The resulting benefits are reduced load on the system bus and further reduction of power consumption.
- Resource sharing: Maximal HW reuse for different applications, resulting with the support of a wide range of requirements with minimal HW.

The HW reuse mentioned above is enabled by a sophisticated configurability of each HW block. This configurability also allows the support of a wide range of external devices, data formats and operation modes. The resulting flexibility is important also because the support requirements are evolving significantly, so expected future changes need to be anticipated and accounted for.

The following further principles guided the choice of support provided by the IPU:

- For key applications that deserve and need HW support (for acceleration or low power), provide the best support (leading to an optimal implementation).
- For additional applications that can benefit from the HW, consider cost vs. benefit of making minor modifications/extensions to support them.
- For all other relevant applications (to be supported by SW), verify that their support is not degraded.
- Whenever possible, let the operating system (and its windowing system) act as it would without the IPU.

37.1.1 Architecture

A simplified block diagram of the IPU can be found here. The role of each block is described in IPU.

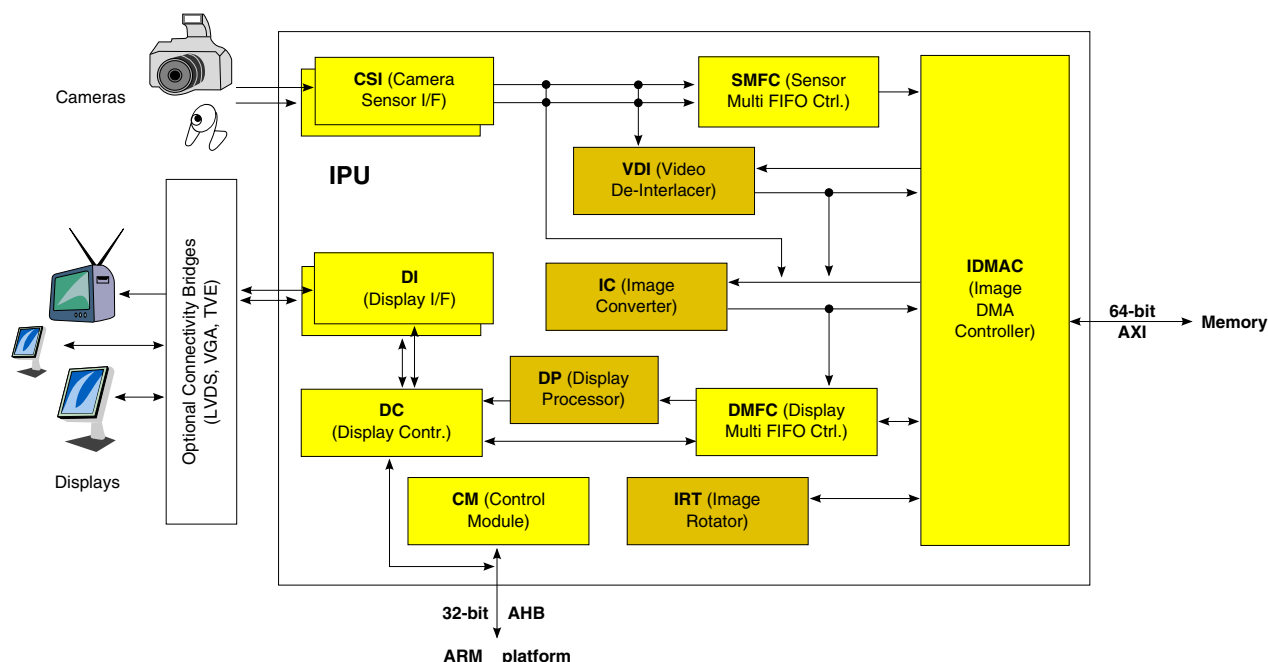

Figure 37-1. IPU Block Diagram

Table 37-1. IPU - Block Description

| Block | Description |
|--------------------------------------|--|
| CSI - Camera Sensor Interface | Controls a camera port; provides interface to an image sensor or a related device. IPU includes 2 such blocks. |
| DI - Display Interface | Provides interface to displays, display controllers and related devices. IPU includes 2 such blocks. |
| DC - Display Controller | Controls the display ports. |
| DP - Display Processor | Performs the processing required for data sent to display. |
| IC - Image Converter | Performs resizing, color conversion/correction, combining with graphics, and horizontal inversion. |
| VDIC - Video De Interlacer | Performs video de interlacing (Interlaced -> progressive) or combining. |
| IRT - Image Rotator | Performs rotation (90 or 180 degrees) and inversion (vertical/horizontal). |
| IDMAC - Image DMA Controller | Controls the memory port; transfers data to/from system memory. |
| DMFC - Display Multi FIFO Controller | Controls FIFOs for IDMAC channels related to the display system. |
| CM - Control Module | Provides control and synchronization. |

37.1.2 Features And Functionality

37.1.2.1 External Ports

IPU has the following ports:

- Two camera ports - each controlled by a CSI sub-block, providing a connection to image sensors and related devices.
- Two display ports - each controlled by a DI sub-block, providing a connection to displays and related devices.
- Memory port - AXI (AHB V3.0) master, controlled by the IDMAC - providing connection to the system memory.
- AHB-lite slave port, providing connection to the ARM Platform (and to any other master connected to the ARM's cross-bar switch).
- Additional ports for control and debug.

37.1.2.1.1 Camera Ports

The role of these ports is to receive input from image sensors (or TV decoders) and to provide support for time-sensitive control signals to the camera.

(Non-time-sensitive controls; configuration, reset are performed by the ARM platform through I2C I/F or GPIO signals).

Each of the camera ports includes the following features:

- Direct connectivity to most relevant image sensors and to TV decoders.
- Interface types
 - Parallel interface
 - Up to 20-bit input data bus.
 - A single value in each cycle, except for special cases listed in the table below (comments column).
 - Programmable polarity.
 - High-speed serial interface - MIPI (Mobile Industry Processor Interface) CSI-2 (Camera Serial Interface) (implemented partly in the IPU and partly in the HSC).
 - Up to four data lanes; up to 800 Mbps per lane
 - Class 1 compliancy (supporting all primary formats)
- The data formats
 - Interleaved color components, up to 16 bits per value (component).
 - The supported formats are listed in the table below.

Table 37-2. Data Formats Supported By The Camera Port

| Format | Resolution | On-The-Fly Processing | Direct path to memory | Comments |
|-----------------------|-------------------------|---|---|--|
| Bayer RGB | 8 bits/value | No | 8- or 16-bit values | MIPI mandatory format |
| | 9-10 bits/value | No | Written to the MSB of a 16-bit word | 10 bits/value is a MIPI mandatory format |
| | 16 bits/value | No | | |
| Full RGB or YUV 4:4:4 | 444/555 mode | Yes, starting with color extension to 8 bits/sample | Yes | MIPI optional formats In parallel I/F: through an 8-bit or 16-bit bus |
| | 565 mode | | | MIPI mandatory format In parallel I/F: through an 8-bit or 16-bit bus |
| | 8 bits/value (888 mode) | Yes | Yes | MIPI mandatory format |
| | 8-16 bits/value | No | 8- or 16-bit components are written to the MSB of a 16-bit word 10 bits/value can also be packed in a 32-bit word | |

Table continues on the next page...

Table 37-2. Data Formats Supported By The Camera Port (continued)

| Format | Resolution | On-The-Fly Processing | Direct path to memory | Comments |
|--|-----------------|-----------------------|--|---|
| YUV 4:2:2 Component order: UY1VY2... or Y1UY2V... | 8 bits/value | Yes | Yes | MIPI mandatory format (UY1VY2...) In parallel I/F: through an 8-bit bus (such as BT.656) or 16-bit bus (such as BT.1120) |
| | 9-10 bits/value | No | Written to the MSB of a 16-bit word | In parallel I/F: through a 10-bit bus (such as BT.656) or 20-bit bus (such as BT.1120) |
| | 16 bits/value | No | Written to the MSB of a 16-bit word | |
| Gray scale | 8 bits/value | No | Yes | |
| | 16 bits/value | No | Written to the MSB of a 16-bit word | |
| Generic data | | No | Yes In a parallel I/F, if wider than 8 bits, each bus word is written to the MSB of a 16-bit word | MIPI mandatory format May be used for any other format, such as JPEG/MPEG4 |

- Scan order: progressive or interlaced data (expected only for YUV 4:2:2) is sent directly to system memory, where it can be read back for further processing.
- Frame size: up to 8192 x 4096 pixels
- Synchronization: video mode
 - The sensor is the master of the pixel clock (PIXCLK) & synchronization signals
 - Synchronization signals are received using either of the following methods:
 - Dedicated control signals -VSYNC, HSYNC - with programmable pulse width & polarity
 - Controls embedded in the data stream, following loosely the BT.656 protocol, with flexibility in code values and location.
- Synchronization : still image capture
 - The image capture is triggered by the ARM platform or by an external signal (such as a mechanical shutter).
 - Synchronized strobes are generated for up to 6 outputs - the sensor and camera peripherals (such as flash, mechanical shutter).
- Additional features
 - Frame rate reduction, by the periodic skipping of frames
 - The supported reduction ratios are: m:n, where m,n<=5
 - This is supported independently for the different destinations - IC, SMFC.
 - Window-of-interest selection
 - Pre-flash - for red-eye reduction and for measurements (such as focus) in low-light conditions

Several sensors can be connected to each of the CSIs. Simultaneous functionality (sending data) is supported as follows:

- Two sensors can send data independently, each through a different port, each using either parallel or fast serial interface.
- Several sensors can send data to the same port, using the MIPI interface (through a HUB), each sensor being identified by different ID's.
- Unpacking and companding capabilities are provided for up to two streams (either through same or different interfaces), while the other ones are treated as generic data.
- Only one of the (non-generic) streams can be transferred to the VDI C or IC for on-the-fly processing, while the others are sent directly to system memory.

The input rate supported by the camera port is as follows:

For parallel interface, the maximum speed of the interface is 240Mhz. The required operating frequency of the interface is calculated in the following way:

$$F = FH * FW * FPS * BI * DF$$

Where

- **FH** = frame height (in pixels)
- **FW** = Frame width (in pixels)
- **fps** = frame rate (frames per second)
- **BI** = typically 35% overhead, should be assumed as 1.35. The actual blanking intervals are a parameter of the attached device.
- **DF** = data format, defines the number of cycles needed to send a single pixel.

The number of cycles needed to send a single pixel depends on the interface and the data format.

Data format examples:

- YUV422 over 16 bit = 1 cycles/pixel
- RGB888 over 8 bit = 3 cycles/pixel
- RGB565 over 16 bit = 2 cycles/pixel
- Bayer/Generic data = 1 cycle/pixel
- YUV422 over 8 bit = 2 cycles/pixel
- BT.656, YUV422 format = 2 cycles/pixel
- BT.1120, YUV422 format = 1 cycle/pixel

Examples of supported interfaces:

- 3.2MP camera, 15fps, yuv422 format, 8 bit interface
- 1080P30, yuv422, 8 bit interface

Fast serial interface (MIPI-CSI2):

- IPU receives 2 components per cycle from the MIPI-CSI2 interface
- The maximum speed of the interface is:
 - 200Mhz for 4 data lanes configuration
 - 250Mhz for 2 data lanes configuration

The maximum bandwidth of the interface is as follows:

- 200Mhz for 4 data lanes configuration (800Mbps/lane, 400MByte/sec)
- 187.5Mhz for 3 data lanes configuration (1000Mbps/lane, 375MByte/sec)
- 125Mhz for 2 data lanes configuration (1000Mbps/lane, 250MByte/sec)
- 62.5Mhz for 1 data lane configuration (1000Mbps/lane, 125Mbyte/sec)

The required operating frequency of the interface is calculated in the same way as for parallel interface above. The DF parameter is different.

- YUV422 = 1 cycle/pixel
- RGB888 = 1.5 cycles/pixel
- Generic data = 2 bytes/pixel

Examples of supported interfaces:

- 3.2MP camera, 2 lanes configuration, 15fps, yuv422 format (~65Mhz)
- 6MP camera, 4 lanes configuration, 15fps, RGB888 format (~182Mhz)

37.1.2.1.2 Display Ports

The role of these ports is to communicate with display devices, either directly or through a controller (such as a graphics accelerator) or a bridge (such as a TV encoder or an LVDS interface bridge).

37.1.2.1.2.1 Access Modes

Two access modes are supported.

37.1.2.1.2.1.1 Synchronous Access

In this mode, the IPU transfers a two-dimensional block of pixels to the display device, in synchronization with the screen refresh cycle.

It is called "video mode" in the MIPI standards.

This mode has a dual role:

- For a RAM-less display or a TV screen, this mode is used to perform the screen refresh process from a display buffer in system memory.
- For a "smart" display, this mode is used to transfer a rectangular block of pixels to the display's screen and, in some cases, also to the display buffer
 - The transferred block may be only part of the screen (the rest of the screen being refreshed by the integrated controller, from the internal buffer). Moreover, a mask can be used to transfer to the display only parts of the block, such as a window partly hidden by other windows.
 - If the block is transferred only to the screen, the transfer rate must be equal to the refresh rate. If, however, the transfer is also to the display's memory, the rate can be reduced to the rate at which the input buffer is updated.

In all cases (including the last one), the IPU sends to the display all the synchronization signals controlling the screen refresh and the block transfer is synchronized with these signals. This synchronization means that tearing effects are avoided when using this mode.

37.1.2.1.2.1.2 Asynchronous Access

This is the main mode used for communicating with an external display controller (possibly in a smart display or a graphics accelerator).

It is called "command mode" in the MIPI standards. In this mode, the IPU performs random access - read/write - to the memory and registers of the controller.

Two types of addressing methods are supported

- Generic linear addressing of pixels and generic data
- 2-dimensional (X/Y) addressing of pixels

The following access types are provided:

- Data transfer to the external device, after on-the-fly processing in the IPU.
- Data transfer (DMA) - read/write - between the host's system memory and the external device, through the IPU's memory port (controlled by the IDMAC), such as the transfer of a rectangular block of pixels (possibly full screen).
- Host access - read/write - to an external device, through the AHB-slave port
 - Access types

- Direct access - emulating a directly-addressed access (see below) This includes burst access (incremental; up to 8 words/burst)
- Low-level access - leaving to the host the explicit generation of the access protocol
- The possible accessing modules include the ARM platform and the system DMA controller (as well as any other AHB master connected to the ARM's cross-bar switch).

Transfer of video/graphics data stream to controller's display buffer is performed using one of the first two modes above. Unlike in the synchronous mode, this process is not tightly-synchronized with the screen refresh cycle. However, a loose synchronization - to avoid tearing - is still possible: the appropriate timing for the transfer can be derived from the VSYNC signal of the screen refresh - either generated by the IPU's display controller or received from the external controller.

The asynchronous access requires the specification of an address. The display interface uses "indirect addressing", namely, there is no address bus, and the address, as well as control and configuration commands, are embedded in the data stream. The access procedure - including writing addresses and commands - is managed autonomously by the interface, in one of two ways:

- Automatic emulation of transparent access, following microcode ("access template") generated by the ARM Platform. This mechanism is very flexible, supporting a wide variety of devices.
- Streaming commands/addresses from a buffer stored (by the ARM Platform) in system memory.

Note that direct access requires the use of the first method - automatic emulation.

37.1.2.1.2.2 Display Interface

The display interface is very flexible and supports a wide variety of devices from major manufacturers. The following interface types are provided (in each of the two display ports)

- Parallel video interface (for synchronous access) - up to 24-bit data bus.
 - Compatible with MIPI-DPI standard .
 - Control protocol - follows Sharp HR and generic TFT definitions
 - Supports BT.656 (8-bit) and BT.1120 (16-bit) protocols
 - Supports HDTV standards SMPTE274 (1080i/p) and SMPTE296 (720p)
- A parallel bidirectional bus interface (for asynchronous access) - up to 32-bit data bus.
 - Compatible with MIPI-DBI standard.

- Control protocol - either system-80 or system-68K The timing and polarity of the signals are programmable.
- Byte-enable - optional, for a 16-bit interface
- Burst access for direct access, the burst is determined by the corresponding signal in the AHB interface.
- A serial interface - 3-wire, 4-wire and 5-wire (two flavors) (for asynchronous access)
- High-speed serial interface: MIPI (Mobile Industry Processor Interface) - DSI (Display Serial Interface) full support, with up to 2 data lanes, up to 4 virtual channels (implemented partly in the IPU and partly in the HSC).

The supported formats for pixel data are

- RGB - color depth fully configurable; up to 8 bits/value (color component)
- YUV 4:2:2, 8 bits/value (for TV encoder)
- All mandatory formats in MIPI's DBI, DPI and DSI.

In the parallel interfaces, the data bus has up to 32 bits. Non-trivial mapping of pixels to the bus is restricted to the 24 LSB's. This mapping is fully configurable and very flexible. In the serial interfaces, the data is mapped in the same way as in the parallel interfaces and then serialized.

The interface also supports "generic data". Such data is transferred - byte-by-byte, without modification - between the system memory and the display device (through a serial interface or 8/16-bit parallel interface). Non-conventional pixel formats can be supported by considering them as "generic data".

For the interface clock, there are the following options (independently for each port)

- Derived from the IPU internal clock (master mode)
- Provided by an external source (slave mode)

The transfer rate supported:

- For single port (for on-chip interfaces):
 - 240 Mega-Accesses/Sec if the DI clock is derived from an external to IPU source (like another PLL)
 - 264 Mega-Accesses/Sec if the DI clock is derived from the IPU clock (HSP_CLK)
 - When off-chip interfaces are involved the rate may be limited by IO capabilities. Please refer to the device's data-sheet for exact numbers.

For synchronous access with one cycle/pixel, this enables, e.g (including 35% blanking intervals)

- 1080p (1920x1080) @ 60 fps

- WSXGA+ (1680x1050) @ 60 fps
- The combined rate for the two ports is up to 240 MP/sec

The interface includes the following additional features:

- Screen size: up to 4096 x 2048 pixels, programmable by software.
- Scan Order: progressive or interlaced
- Synchronization
 - Programmable horizontal and vertical synchronization output signals (for synchronous access)
 - Data enabling output signal
- Software contrast control using 8-bit programmable pulse-width modulation (PWM)
Two dedicated PWM outputs are provided

Connecting To Display Devices

IPU allows the connectivity to multiple display devices. In particular, it supports the following setup:

- Primary LCD display; can be smart, dumb (RAM-less) or dual-port; may use fast serial, or the parallel interface or (through an integrated bridge) LVDS interface.
- Second LCD display; can be smart or dumb (RAM-less); may use fast serial, parallel or serial interface or (through an integrated bridge) LVDS interface.

Each of the above connections has independent settings - interface timing, access template, chip-select, etc.

Simultaneous functionality of the above devices is possible in each of the following ways:

- Two devices can be accessed (synchronously or asynchronously) independently, each through a different port: each using any of the available interfaces.
- Two devices can time-share asynchronous accesses through the legacy serial & parallel interfaces, using the CS signals.
- Two devices can be accessed - synchronously or asynchronously - through the same port, using the MIPI interface (through a HUB), each device being identified by different ID's.
- An asynchronous access can be performed during vertical blanking intervals of a synchronous access (screen refresh; to the same or other device).

The possibilities for simultaneous functionality by time-sharing the legacy interfaces in a single port are summarized in the following table.

Table 37-3. Simultaneous Functionality of Display Port By Time-Sharing Legacy Interfaces

| Primary Display Type | Second/Third Display Type | | |
|--|-----------------------------------|--|--|
| | Smart Display Serial Interface | Smart Display Parallel Interface Asynchronous access | RAM-less display or TV screen |
| Smart Display Parallel Interface Asynchronous access | Yes | Yes | Yes; access to the smart display is restricted to blanking intervals |
| Dual Port Smart Display Synchronous access | Yes | Yes, access to the secondary display is restricted to blanking intervals | Not Available |
| TFT RAM-less Display Or TV screen | Yes | Yes, access to the smart display is restricted to blanking intervals | Not Available |
| Graphics Accelerator | Yes | Yes, if the accelerator supports a chip select functionality | Not Available |

37.1.2.1.3 Memory Port

The memory port is an AXI (AHB V3.0) master port, used to read/write data - typically two-dimensional blocks from/to system memory.

The interface supports the following features

- Clock rate up to 264 MHz (equal to the internal clock)
- 64-bit data bus
- The supported data formats are listed in the table below.

Table 37-4. Data Formats Supported By The Memory Interface

| Format | Resolution | Input/Output | Comments |
|--|--------------|--------------|---|
| Non-interleaved YUV (in three separate buffers) | 8 bits/value | both | 4:4:4, 4:2:2, 4:2:0 formats |
| Partially-interleaved YUV (in two separate buffers) | 8 bits/value | both | 4:2:2, 4:2:0 formats Y buffer and UV buffer |
| Interleaved YUV (all color components in a single buffer) | 8 bits/value | both | 4:4:4 format (YUV...) 4:2:2 format (UY1VY2... or UY2VY1... or Y1UY2V...or Y2UY1V...) |

Table continues on the next page...

Table 37-4. Data Formats Supported By The Memory Interface (continued)

| Format | Resolution | Input/Output | Comments |
|----------------------------------|--|--------------|---|
| Interleaved true color | 8, 12, 16, 18, 24, 32 bits/pixel 0 - 8 bits per R/G/B/A value | both | Flexible component location A: translucency value (only in input) |
| Coded color (using a palette) | 4, 8 bits/pixel | input only | |
| Gray scale | 8 bits/pixel | both | |
| | 4 bits/pixel | input only | Transferred to display port |
| Generic data (Transparent M) | 8 bits/unit | both | E.g.: From CSI to DI Compressed data to/from DP Translucency for combining |

- The pixel formats are translated to/from a uniform internal format: RGBA/YUVA 8:8:8:8
- The supported ordering of bytes and pixels is little endian. For 4 bits/pixel, big endian is also supported.
- Addressing modes include:
 - Sequential access (to a contiguous memory buffer) - for generic data.
 - Raster-scan within a two-dimensional window of a video/display buffer - for both pixel and generic data.
 - Raster-scan of two-dimensional blocks within a two-dimensional window (for rotation of pixel data)
- Additional features
 - Scan order: progressive or interlaced Interlaced access is supported for fields which are stored either in separate memory buffers or with rows interleaved in a single buffer.
 - Reordered scan, implementing inversion and rotation.
 - Rotation and horizontal inversion - only when transferring two-dimensional blocks (to/from the IRT)
 - Vertical inversion - also in row-by-row raster-scan
 - Scrolling
 - Applications Panning within a frame Frame scrolling
 - Not supported for non-interleaved and partially-interleaved formats
 - Resolution Vertical: single pixel Horizontal: 18 BPP - 4 pixels; 12, 4 BPP or YUV 422 - 2 pixels; other formats - one pixel
 - Conditional read (for combining): fully-transparent or hidden pixels are not read.

- This is supported, for graphics, by reading the transparency (alpha) from a separate buffer
- Input/output FIFOs (in the SMFC, DMFC and in the processing sub-blocks) - size adjusted to provide resilience for latency of up to 1500 cycles.

37.1.2.1.4 Processing

The IPU processes rectangular blocks of pixels. The processing is performed in these sub-blocks - VDIC, DP, IC and IRT.

(see the IPU block diagram and [Table 37-1](#)).

37.1.2.1.4.1 Processing flows

Several time-shared data flows are supported, as described in the following table.

Table 37-5. Time-Shared Data Flows through the IPU

| Name | Number | Type | Flow | Target | Restrictions |
|------------------------|---|------|---|---|--|
| Display Refresh/Update | 5 flows (at most two of them of type DS1) | DS1 | Fmem -> DP -> Display | Synchronous Access (e.g. display refresh; controlled by the DI) | |
| | | DS2 | Fmem -> DP -> Display | Asynchronous Access (e.g. display update) | |
| | | DS3 | Fmem <-> Display | Generic Data Transfer | |
| | 1 flow | DS4 | ARM Platform<-> Display | Direct Access | |
| Video Playback | flows | PL1 | Bmem -> VDIC -> IC -> Bmem -> IRT -> Fmem + DSx | Main option | |
| | | PL2 | Fmem -> IRT -> Bmem -> IC -> DP | Low power (branching to DSx, as a video plane) | Large enough window No other video flows |
| | | PL3 | Fmem -> VDIC -> IC -> DP | Low power (branching to DSx, as a video plane) | Interlaced source Large enough window No other video flows |

Table continues on the next page...

Table 37-5. Time-Shared Data Flows through the IPU (continued)

| Name | Number | Type | Flow | Target | Restrictions |
|------------------|---|------|--|---|---|
| Camera Pre-view | 1 flow (VF2 may be used also as a playback flow) | VF1 | Sensor -> IC -> Bmem -> IRT -> Fmem+DSx | main option | Single progressive input |
| | | VF2 | Sensor -> Fmem -> VDIC -> IC -> Bmem -> IRT -> Fmem+ DSx | two inputs and/or interlaced input | When the VDIC is used, one of the three input fields can go directly from the sensor to the VDIC. In that case the sensor output goes to the memory via the VDIC and not the SMFC |
| | | VF3 | Sensor -> IC -> DP | Low power Smart Display Tearing-less (branching to DS2, as a video plane) | Single progressive input Refresh rate = 2x sensor frame rate Large enough window No other video flows |
| | | VF4 | Sensor -> IC -> Fmem + DS1 | Low power RAM-less Display Single Display Buffer (in internal memory) Tearing-less | Single progressive input Refresh rate = 2x sensor frame rate Large enough window No other video flows |
| Video Record | 1 flow | RCx | IC -> Bmem -> IRT -> Fmem | (branching from VFx) | |
| Graphic Overlays | 2 flows | GF1 | Fmem -> IC | (combining with the main flow) | |
| | 2 flow | GF2 | Fmem -> DP | | |

Comments

- System memory usage - legend
 - Fmem: frame double-buffer (page-flip) in system memory (typically external memory: DDR DRAM [address 0x1000_0000 - 0xFFFF_FFFF])
 - Bmem: two possibilities
 - A frame double buffer, as above
 - A band (4-256 rows) double-buffer (page-flip) in system memory (could be internal memory: OCRAM [address 0x0900_0000 - 0x093F_FFFF])
 - Direct arrow between two processing stages represents an internal pipeline
- Time-sharing
 - IC can time-share tightly three flows: one VFx, one RCx and one PLx (with independent processing parameters)
 - DP can time-share one DS1 flow and a one DS2 flow (each with different destinations and independent processing parameters)

- Direct access to display (DS4) time-shares tightly the display port with other active DSx flows.
- Other time-sharing (between PLx flow and DS2 and DS3 flows in IRT) is frame-by-frame
- Any of the processing stages in the above flows can be skipped.
- Triggering and synchronization
 - Flow segments starting from a sensor are triggered and synchronized by input from the sensor
 - Flow segments ending with display refresh are triggered and synchronized by the refresh control mechanism in the DI.
 - Flow segments starting and ending in system memory, are triggered either by the double buffering mechanism or by explicit configuration and are processed continuously without delay, at a rate determined by the available resources. These flow segments have a lower priority than the sensor/display-driven flows.

The functionality of each of the processing blocks is described below.

37.1.2.1.4.2 Display Processor (DP)

The Display Processor performs all the processing required for data sent to a display.

- Input: from the IC and/or from system memory
 - Order: rows, progressive or interlaced
 - Format: YUVA/RGBA, non-decimated, 8 bits/value
- Processing chain
 - Combining 2 video/graphics planes
 - Overlaying a simple HW cursor 32 x 32 pixels, uniform color; may be combined logically with the full plane.
 - Color conversion/correction - linear (multiplicative & additive) programmable including:
 - YUV <-> RGB, YUV<->YUV conversions where YUV stands for any one of the color formats defined in the MPEG-4 standard
 - Adjustments: brightness, contrast, color saturation, etc.
 - Special effects: gray-scale, color inversion, sephia, blue-tone, etc.
 - Color-preserving clipping, for gamut mapping
 - Hue-preserving gamut mapping - for minimal color distortion
 - Applied to the output of combining or to one of the inputs
 - Gamma correction and contrast stretching - programmable piecewise-linear map
- Output: to display (through the DC)
 - Rate: up to 240M pixels/sec
 - Format: YUV/RGB, non-decimated, 8 bits/value

The DP processes a single data flow at any given time, but supports up to three data flows by time sharing.

- A Primary flow:
 - The input is loaded periodically using a timer (e.g. for a synchronous access)
 - Optionally, frames are skipped if the content has not changed (as appropriate for a smart display)
- Two secondary flows:
 - Asynchronous; processed when the DP is not needed for the primary flow (during blanking intervals or when a primary frame is skipped).
 - The two secondary flows are switched frame-by-frame.

37.1.2.1.5 Video De-Interlacer or Combiner (VDIC)

The Video De-Interlacer as well as the Combiner have two operation modes

- De-interlacing: converts an interlaced video stream to progressive order.
- Combining: combines two video/graphics planes and a background color

37.1.2.1.5.1 De-interlacing in the VDIC

The Video De-Interlacer converts an interlaced video stream to progressive order, using a high-quality 3-field motion-adaptive filter.

- Video source - SDTV: 480i30 (720x480 @ 30 fps) or 576i25 (720x576 @ 25 fps) and HDTV: 1080i/30 (1920x1080 @ 30 fps)
- Input: -three consecutive fields
 - Source
 - The most recent field may come from the CSI or from system memory
 - The other two fields are read from memory
 - Field size: up to 968x1024 pixels (may be a vertical stripe of a wider field; e.g. 1920 pixels)
 - Pixel format: YUV 4:2:2/4:2:0, 8 bits/value
- Output: progressive frame
 - Destination: to system memory or to the Image Converter.
 - Frame size: up to 968x2048 pixels
 - Rate: up to 240 MP/sec (e.g., 1920x1080 @ 85 fps)
 - Format: same as input format

The de-interlacing is performed using a high-quality 3-field filter which is motion adaptive:

- For slow motion - retains the full resolution (of both top and bottom fields)
- For fast motion - prevents motion artifacts

The VDIC supports a single video stream at any given time.

37.1.2.1.5.2 Combining in the VDIC

- Input for combining: two progressive video/graphics planes
 - Source: system memory
 - Plane size: up to 1920x1200 pixels.
 - Pixel format: RGB/YUV 4:2:2, 8 bits/value

In this mode:

- The two input planes are read from system memory, using the previous field and next field input FIFOs.
- Their relative height, up/down is configurable
- Each of them may cover only part of the output frame. For the remaining part of the frame, the chip uses the following values:
 - Down plane: a 24-bit background color, stored in an internal register
 - Up plane: a transparent pixel
- The combining method is identical to the one in the DP, IC.

37.1.2.1.5.3 Image Converter (IC)

The Image Converter performs various operations on a video stream.

- Input: from sensor or from system memory
 - Frame size: up to 4096x4096 pixels
 - Rate: up to 200M pixels/sec (e.g. 5 MP @ 30 fps + 35% blanking intervals)
 - Order: rows, progressive. If resizing is not used, interlaced order is also acceptable.
 - Pixel format: YUV/RGB, 8 bits/value
- Processing chain:
 - Resizing
 - Fully flexible resizing ratio Maximal downsizing ratio: 8:1. Subject to this limitation, any N->M resizing can be performed.
 - Independent horizontal and vertical resizing ratios.
 - Color conversion/correction - linear (multiplicative & additive) programmable, including:
 - YUV <-> RGB, YUV<->YUV conversions where YUV stands for any one of the color formats defined in the MPEG-4 standard
 - Adjustments: brightness, contrast, color saturation...
 - Special effects: gray-scale, color inversion, sephia, blue-tone...

- Combining with a graphics plane (e.g. application-specific overlay)
- Horizontal inversion
- Output: to system memory or (for a single active flow) to a display device (through the DP).
 - Frame size: up to 1024x1024 pixels
 - Rate: up to 100Mpixels/sec (e.g. 1920x1080 @ 30 fps)
 - Order: rows, progressive. If resizing is not used, interlaced order is also acceptable.
 - Format: YUV/RGB, 8 bits/value

The IC supports three time-shared data flows: record, camera preview and playback (the first two share a common input).

37.1.2.1.5.4 Image Rotator (IRT)

- Input/output: from/to system memory
 - Rate
 - Up to 120M pixels/sec (when a single task is active).
 - Up to 100M pixels/sec (when more than one task is active).
 - Order: raster scan of 8x8-pixel blocks
 - Format: YUV/RGB, non-decimated, 8 bits/value
- Transformation: combination of the following
 - 90-degree rotation
 - Horizontal inversion
 - Vertical inversion

37.1.2.1.6 Automatic Procedures

The IPU is equipped with powerful control and synchronization capabilities to perform its tasks with minimal involvement of the ARM Core and minimal use of memory.

In particular, it includes:

- An integrated DMA controller with an AXI master port, allowing autonomous access to the system memory.
- An integrated display controller, performing screen refresh of a RAM-less display.
- A page-flip double buffering mechanism, synchronizing read and write access to system memory, to prevent tearing effects.
- A double/triple buffer synchronization mechanism with a video/graphics source.
- Internal synchronization, e.g., between input from sensor and output to display

As a result, in most cases, the ARM platform is involved only when it also performs part of the processing (e.g. video coding). In particular, the following procedures are performed by the IPU completely autonomously:

- Screen refresh for RAM-less displays
- Update of the ("partial plane") display buffer used for screen refresh (located either in system memory or in an external display controller, e.g. of a smart display or graphics accelerator), when the content is generated in a different ("full plane") buffer.

Typically, there are extended periods of times in which there is no other activity in the system. The ARM platform, being idle, can be put to a low-power mode, reducing the power consumption and extending significantly the battery life.

The IPU supports several techniques to reduce further the power consumption of the display system:

- Dynamically optimized screen refresh rate (see [Screen Refresh](#) below)
- Optimized update of the display buffer (see [Update Of The Display Buffer](#) below)
- Dynamic backlight control, with low-light compensation by image enhancement

Further features and capabilities of the automatic procedures are outlined below

37.1.2.1.6.1 Screen Refresh

- The refresh rate may vary within a predefined range. Within this range, the rate is dynamically adjusted to the content update rate.
- An indication about the availability of new content is obtained as follows:
 - If the page-flip double buffering is used, the mechanism provides this indication
 - If only a single buffer is used (and incrementally updated), the IPU can receive an indication of a modification from the ARM platform (by setting an internal flag).
- The IPU counts the refresh cycles: the total and those with new content. The ARM platform can use these counters to optimize display management (e.g. switching display buffer compression on/off). The counters are reset by the ARM platform.
- The transferred data may be processed on the way, using the IC and DP.

37.1.2.1.6.2 Update Of The Display Buffer

- Conditional update The IPU can receive an external "snooping" signal indicating a modification of the full plane buffer (as during screen refresh above). It monitors the signal and, upon detection, it performs one of the following:
 - Performs an update, without any SW intervention
 - Interrupts the ARM core, that can initiate some more involved procedure (e.g. selective update)
- Automatic display of a changing image (animation) or moving image (scrolling) This is implemented by reading frames (from a full plane buffer) with incremental offset.

When the IPU reaches the last programmed frame, it can perform one of the following:

- Return to the first frame, without any SW intervention
- Interrupt the ARM platform, to generate the next content.
- The timing of the update can be adjusted to avoid tearing.
- The transferred data may be processed on the way, using the IC and DP

37.1.2.1.6.3 Camera Preview

- Tearing artifacts can be prevented by (automatic) page-flip double buffering in system memory
- Alternatively, the video stream from an image sensor can be sent directly to the display buffer used for screen refresh. The significance of this option is that only a single frame buffer is needed (and not two). This buffer may be located either in system memory or in an external display controller.
 - This option is useful, e.g., in a low frame rate, when tearing is not visible.
 - When tearing must be prevented, the refresh cycle in the display can be synchronized with the timing signals from the sensor (two refresh cycles for each input frame): the IPU receives a VSYNC signal from the sensor and generates from it synchronization signals for the display.

37.2 External Signals

The table found here describes the external signals of IPU1.

Table 37-6. IPU1 External Signals

| Signal | Description | Pad | Mode | Direction |
|------------------|-------------|------------|------|-----------|
| IPU1_CSI0_DATA00 | - | EIM_D27 | ALT2 | I |
| IPU1_CSI0_DATA01 | - | EIM_D26 | ALT2 | I |
| IPU1_CSI0_DATA02 | - | EIM_D31 | ALT3 | I |
| IPU1_CSI0_DATA03 | - | EIM_D30 | ALT3 | I |
| IPU1_CSI0_DATA04 | - | CSI0_DAT4 | ALT0 | I |
| IPU1_CSI0_DATA05 | - | CSI0_DAT5 | ALT0 | I |
| IPU1_CSI0_DATA06 | - | CSI0_DAT6 | ALT0 | I |
| IPU1_CSI0_DATA07 | - | CSI0_DAT7 | ALT0 | I |
| IPU1_CSI0_DATA08 | - | CSI0_DAT8 | ALT0 | I |
| IPU1_CSI0_DATA09 | - | CSI0_DAT9 | ALT0 | I |
| IPU1_CSI0_DATA10 | - | CSI0_DAT10 | ALT0 | I |

37.4.2.2 IBIW & IBIR - Internal bus interface for write and read

The Internal Bus Interface handles the internal IPU protocol communicating between the IDMAC and the IPU's sub modules.

The IBIR handles channels that perform read from external memory. The IBIW handles channels that perform write accesses to external memory.

37.4.2.3 FCW & FCR - Format converter write and read

The format converter performs packing ("write direction") / unpacking ("read" direction) of pixels with programmable position and width of color components, decoding 4- or 8-bits coded pixels according to a loaded look-up table, panning of an image read from the system memory according to a panning offset (start pixel address).

The format converter supports formats with a pixel width of 4, 8, 12, 16, 18, 24 or 32 bits. The format converter unit handles two pixels simultaneously.

The IPU sub modules can handle only the formats, presented below. Each component is 8 bit:

**Figure 37-4. IPU internal pixel formats**

The pixel can be stored in the memory in the formats presented below. (R/G/B means that this could component can be R or G or B; A is the location of the alpha component).

For Read:

| | | | |
|---------|---------|---------|---------|
| R/G/B/A | R/G/B/A | R/G/B/A | R/G/B/A |
|---------|---------|---------|---------|

For Write:

| | | | |
|-------|-------|-------|---|
| R/G/B | R/G/B | R/G/B | A |
|-------|-------|-------|---|

| | | | |
|---|-------|-------|-------|
| A | R/G/B | R/G/B | R/G/B |
|---|-------|-------|-------|

Figure 37-5. IPU external pixel formats

Formatting parameters are written in the channel parameter memory ([CPMEM - Channel Parameter Memory](#)). The following parameters are used:

- Offset OFS0 between MSB position of the color component 0 and MSB position of packed pixel. The color component 0 occupies the most significant bits of the unpacked pixel (mostly this is the R component). The OFS0 range is from 0 to 31.
- Color component 0 width (WID0 minus 1).
- Offset OFS1 between MSB position of the color component 1 and MSB position of packed pixel. The color component 1 occupies the middle left bits of the unpacked pixel (mostly this is the G component). The OFS1 range is from 0 to 31.
- Color component 1 width (WID1 minus 1).
- Offset OFS2 between MSB position of the color component 2 and MSB position of packed pixel. The color component 2 occupies the middle right bits of the unpacked pixel (mostly this is the B component). The OFS2 range is from 0 to 31.
- Color component 2 width (WID2 minus 1).
- Offset OFS3 between MSB position of the color component 3 and MSB position of packed pixel. The color component 3 occupies the least significant bits of the unpacked pixel (mostly this is the A component). The OFS3 range is from 0 to 31. For write specified DMA channels, the OFS3 value is set to 24 or 0 bits.
- In cases of read with separate alpha (alpha is located in a separate buffer in the system's memory than the pixel data), the alpha component size is defined according to WID3.

The figures below show examples of data packing and unpacking.

Figure 37-6. Data Packing Example

Functional Description

Figure 37-7. Data Unpacking Example

If read data has the coded format, it is decoded via the look-up table. The Look-Up Table Memory ([LUT- Look Up Table](#)) must be loaded at the IDMAC initialization step. The LUT output format must match the IPU internal format RGBA 8888 where R is placed in MSB and A is placed in LSB. The A field is used only for graphics data.

37.4.2.4 Buffering units

The buffering units (BUFW, BUFR) are used to store the data consisting of different coded color components.

- On write transactions (BUFW), before writing to memory & after the format has been coded.
- On read transactions (BUFR), after reading from memory & before the format has been decoded.

Each buffering unit includes 4 X 64 bytes buffers. Each buffer, for each direction, can handle any kind of color component (interleaved - Y / partial interleaved - Y, UV / non interleaved - Y, U, V).

The Write buffers are controlled by the buffer controller for write (BCW) and AXIW units.

The Read buffers are controlled by the buffer controller for read (BCR) and AXIR units.

37.4.2.4.1 Handling real time channels

The memory controller connected to the AXI bus of the IPU can use the AXI ID associated with each burst in order to distinguish between real time and non real time channels.

In order to do that, the user has to set the channel's ID according to the settings in the memory controller and set the priority of the channel according to its nature. The buffer controller (BCW/BCR) holds all the pending requests that won the arbitration. However, as the memory controller can distinguish between the real time channels and non real time channels within the IPU, there could be a situation where the real time requests are blocked as the IPU's queue is filled with non real time requests. To avoid that, the user can limit the number of non-real time requests in the queue.

The queue for read requests can handle up to 8 requests. The queue for write requests can handle up to 6 requests. The user can limit the number of non real time requests by setting the USED_BUFS_MAX_W for write requests and USED_BUFS_MAX_R for read requests. The feature that limits the number of requests is enabled by setting the USED_BUFS_EN_R bit for the read requests and USED_BUFS_EN_W for the write requests.

37.4.2.5 AXIW - AXI Write and AXIR - AXI Read

The AXI Master Interfaces are responsible for data transfer from/to the system memory. The Interface supports only 64-bits burst accesses of 1-8 words, with nonalignment of a byte resolution.

2 separate & independent AXI masters are used for "read" (AXIR) & "write" (AXIW), each can be programmed (via CPMEM) with 4 different IDs to support out-of-order accesses within bursts.

37.4.2.6 CC_W & CC_R - Channel Control Write and Read

The Channel Control unit is the main control unit of the IDMAC.

- It arbitrates the channels according to the priority.
- Controls the address arithmetic unit.

- Functions as a memory interface to the CPMEM. It reads the parameters from the CPMEM, prepares the controls accordingly and writes back updated parameters to the CPMEM.
- The read unit provides the parameters to the IBIR unit
- The write unit provides the parameters to the AXIW unit

The CC calculates all the parameters related to the access except the address and BS (burst size), which are calculated at the AAU.

The priority is set according to:

- The channel's corresponding bit in the IDMAC_CH_PRI_1 & IDMAC_CH_PRI_2 registers.
- The watermark signal generated from the sub module. The watermark signal is ignored unless the channel's corresponding IDMAC_WM_EN bit is set.
- Special priority for alpha channels

A priority value is calculated for each of the enabled channels according to the above conditions. Then, the CC unit selects between the channels with the same priority value in a round-robin fashion.

Table 37-11. Calculated priority value

| alpha channel | Channel's priority bit | watermark signal | Priority Value |
|---------------|------------------------|------------------|----------------|
| 0 | 0 | 0 | 0 |
| 0 | 0 | 1 | 1 |
| 0 | 1 | 0 | 2 |
| 0 | 1 | 1 | 3 |
| 1 | 0 | 0 | 1 |
| 1 | 0 | 1 | 2 |
| 1 | 1 | 0 | 3 |
| 1 | 1 | 1 | 4 |

37.4.2.6.1 Locking the arbitration and reordering the AXI bursts

The performance of the overall system can be improved by sending AXI bursts of consecutive addresses. This can be done by reordering the AXI bursts in a way that accesses that belong to the same channel will be sent one after the other. This can be done by controlling the IDMAC_LOCK_# bits of the corresponding channel.

An IDMAC request that won the arbitration will be served for the next bursts according to the settings of the IDMAC_LOCK_# bits. The block that issued the request (DMFC on IPU) will assert the request only if it has enough room in its FIFO to accept the number

of bursts defined by the IDMAC_LOCK_# bits. IPU provides this capability to channels that serve real time screen refresh to synchronous display (23,27,28). In addition, it provides this capability to channels that may generate very short AXI bursts (IC and IRT)

37.4.2.7 AAU_W & AAU_R- Address Arithmetic Unit for Write and Read

The AAU_R & AAU_W units calculate the address in the system memory to be accessed by the IPU. These units also calculate the burst size (BS). The address calculation is done according to parameters stored in the CPMEM.

The following main addressing parameters are used:

- XB-Horizontal pixel position in frame
- YB-Vertical pixel position in frame
- SL-Stride line minus 1 (gap in bytes between two pixels in the same column in two consecutive rows).
- SX-Horizontal pixel scrolling offset
- SY-Vertical pixel scrolling offset
- EBA-Frame buffer base address in bytes (there are two such parameters to support double buffering)
- BPP-Bits per pixel
- FW-Frame width minus 1
- FH-Frame height minus 1

Relations between the addressing parameters and image frame are shown in the table below.

The system memory address in bytes is calculated as:

$$\text{ADDR} = \text{EBA} + (\text{XB} + \text{SX}) * \text{BPP} + (\text{YB} + \text{SY}) * (\text{SL} + 1)$$

with $0 < \text{XB} \leq \text{FW}$ and $0 < \text{YB} \leq \text{FH}$.

For non-interleaved formats the 4 LSB bits of SX are defined according to the IOX parameter.

When double buffering is used, the EBA0 is the base address of the buffer 0 and the EBA1 is the base address of the buffer 1. The IPU_CHA_CUR_BUF Register is a status register. It contains 1-bit pointers to the current working buffers for all IPU DMA channels. The IPU automatically toggles a pointer after completion of the current buffer processing. If the ARM platform is a data source for specific double-buffered channel, it should check this status bit in order to know what is the IPU current buffer. The ARM platform is allowed to write to the buffer only when a working DMA channel does not

use it. After the ARM platform has been fill the buffer, it has to set the corresponding bit in the IPU_CHA_BUF0_RDY and IPU_CHA_BUF1_RDY Registers. If needed, the ARM platform can only clear the pointer by writing 1 but not set it.

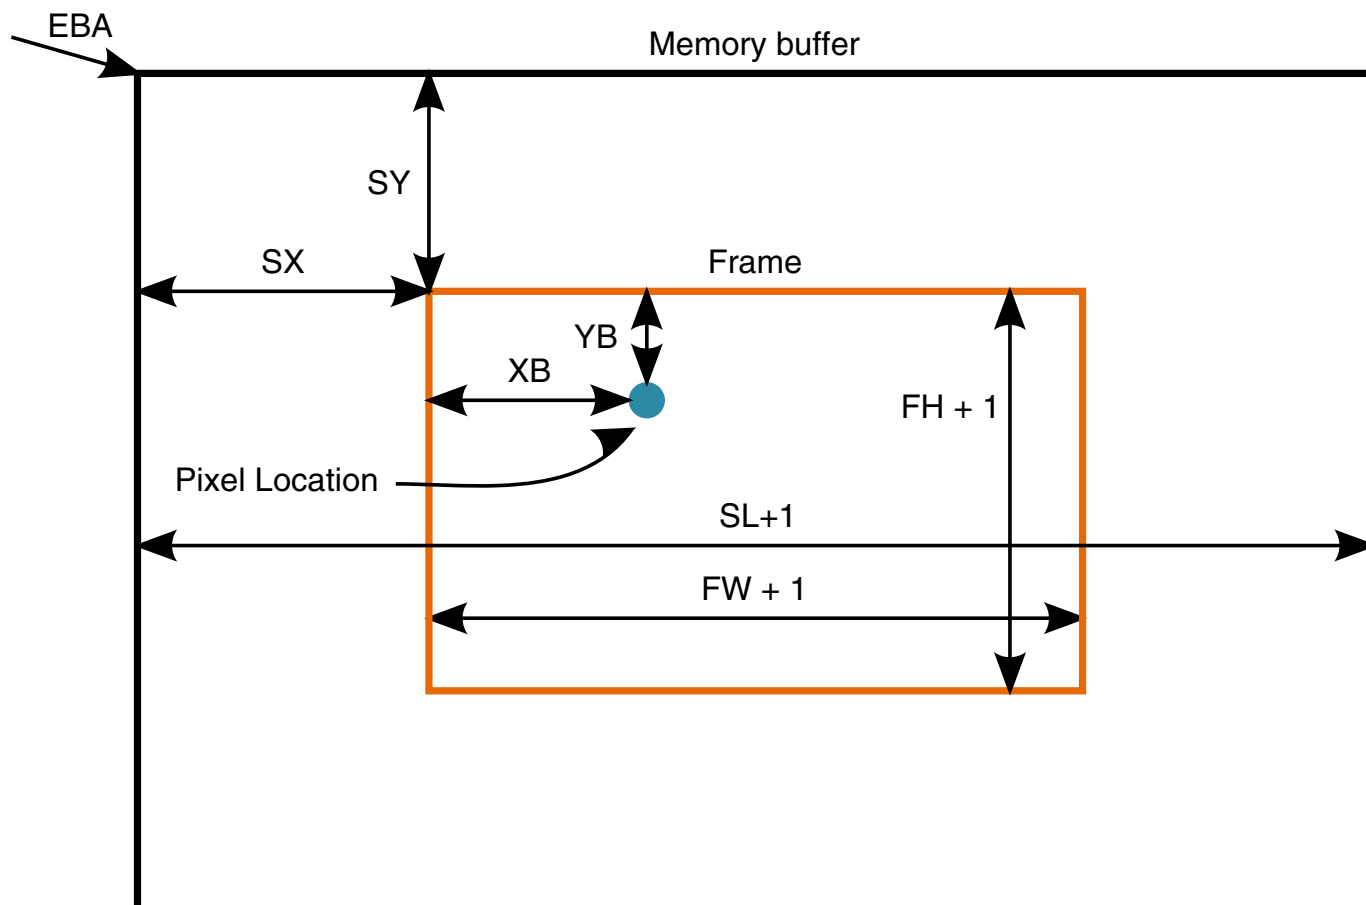

Figure 37-8. Addressing Parameters and Image Frame

The XB and YB coordinates are calculated according to addressing mode. There are two addressing modes:

- 2D mode
- Block mode

In 2D mode the pixel data is transferred to the memory row-by-row. There are two ways to use 2D mode: start from YB = 0 and finish at YB ≤ FH (YB is incremented) or start from YB = FH and finish at YB ≤ 0 (YB is decremented). The second option provides vertical flip of the image.

In block mode the frame is divided into blocks. This is needed for rotation or post-filtering, where the order used for data transfers is block-by-block. The order of the block transfer is according to the VF, HF and ROT bits in the IDMAC Channel Parameter

Memory. The order within the block is row-by-row where the block size is limited by the block width (BW) and block height (BH) parameters. The BW and BH parameters are set by IC rotation section and cannot be configured through the Channel Parameter Memory.

The Channel Control is responsible for the address calculation flow. It takes channel parameters from the Channel Parameter Memory, updates them and controls the Address Arithmetic Unit.

37.4.2.7.1 Scrolling support

Automatic display of a changing image (animation) or moving image (scrolling) is implemented by reading frames (from a background buffer) with incremental offset. Enabling the scrolling feature is done by setting the channel's corresponding SCE bit.

The scrolling step is controlled by channel's corresponding SDX and SDY parameters, and the scrolling direction is defined by the channel's corresponding SDRX and SDRY parameters. The maximum number of scrolled frames to be read is defined by the channel's corresponding SM parameter.

When the last programmed frame is reached (IDMAC's internal counter reached SM), IDMAC can perform one of the following (controlled by the SCC bit):

- Return to the first frame, without any SW intervention. The return point is defined by SX0 and SY0 parameters.
- Interrupt the ARM platform, to generate the next content.

37.4.2.8 ATC - Alpha Transparency Controller

The Alpha transparency controller (ATC) handles the alpha buffers on the external memory for cases where the pixel data and the alpha data are located on separate buffers (separate alpha mode).

In that case the IDMAC reads the alpha data and the pixel data, merge them together and provides a pixel that includes the alpha information to the relevant sub module. The ATC's main functions are:

- Generates requests for alpha channels, following a request to pixel data from the module.
- Maintain an internal alpha memory buffer for each channel.
- When there isn't enough alphas in the memory the ATC blocks the corresponding pixel channels.
- When there is a request of pixel channel the ATC load and accumulate its alphas in a register.

Functional Description

- ATC memory controller can manage 8 channels of alphas.
- ATC supports synchronous new frame before end of frame errors.

In order to configure the channel to use separate alpha the channel's corresponding IDMAC_SEP_AL bit should be set in addition to the ALU bit in the CPMEM of the corresponding channel.

The following figure is the ATC's block diagram.

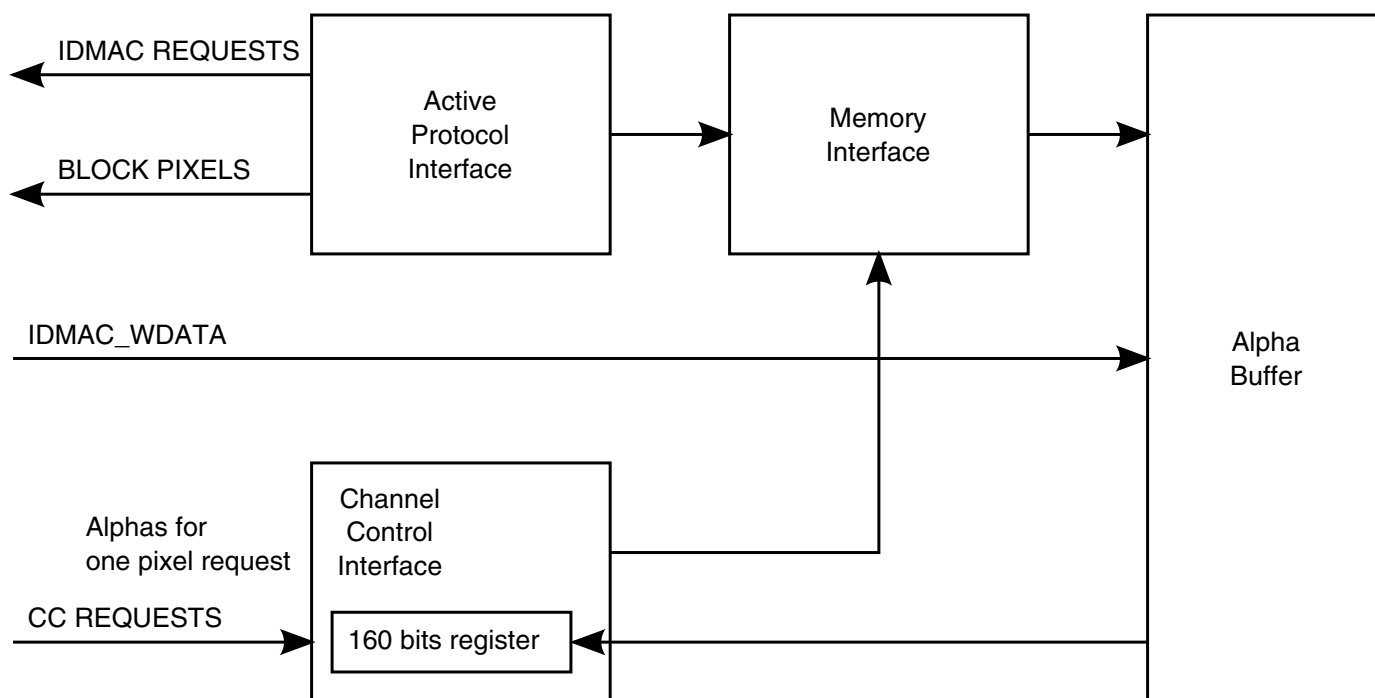

Figure 37-9. ATC block diagram

The ATC alpha buffer memory can hold up to 8 buffers of alphas. A pointer to a buffer in the ATC memory is defined according to the ALBM parameter in the CPMEM. The table below describes the relations between a data channel, an alpha channel and the pointer in the alpha buffer memory.

Table 37-12. Alpha channels mapping

| data channel number | associated alpha channel number | Alpha buffer memory (ALBM) |
|---------------------|---------------------------------|----------------------------|
| 14 | 17 | 0 |
| 15 | 18 | 1 |
| 27 | 31 | 2 |
| 29 | 33 | 3 |
| 23 | 51 | 4 |
| 24 | 52 | 5 |
| 25 | 19 | 6 |

37.4.2.8.1 Conditional read

The alpha data can be used to reduce reads from the memory of pixels that are going to be transparent (alpha = 0). The conditional read feature is enabled by the CRE bit in the CPMEM.

If all of the corresponding alpha values for a single burst of pixels are equal to zero, the IDMAC will block the access to the external memory and provide a data of all zeros to the corresponding channel. This way some of the accesses to the memory can be prevented, thus reducing the load on the memory.

37.4.2.9 LUT- Look Up Table

When working in coded pixel format, the data read from the memory is the decoded value of pixel according to address given. In case of 8 bit code, the data read from the memory is the decoded value of the pixel according to the address given.

In case of 4 bit code configuration, The address of the 4 bit decoded values is set according to DEC_SEL parameter in the CPMEM

00 = addresses 0 to 15

01 = addresses 64 to 79

10 = addresses 128 to 143

11 = addresses 192 to 207

Table 37-13. Look-Up Table Memory Structure

| Address | Word | DEC_SEL | Description |
|---------|---------|--------------------|---|
| 0 | Word0 | 4 BPP = 00 | Decoded Pixels [15:0] for both 8 and 4 bit coded configuration |
| ... | ... | 8 BPP = don't care | |
| 15 | Word15 | | |

37.4.2.10 CPMEM - Channel Parameter Memory

The CPMEM holds the configuration parameters for each IDMAC channel. The CPMEM can holds the settings of 80 channels.

Each channel's settings are defined by a two mega-words. Each mega-word is 160 bits wide. The following diagram illustrates the CPMEM's structure.

**Figure 37-10. CPMEM structure**

Each IDMAC channel can be configured to work in one of two different modes:

- Non Interleaved mode where the Y:U:V data is organized in 3 separate buffers in the system's memory
- Interleaved mode where the Y:U:V data is organized in a single buffer in the system's memory

The parameters and the way they are organized are different for each mode. The Pixel Format Select (PFS) value of the CPMEM words are used by the IPU to determine if the words should be interpreted as interleaved or non-interleaved format.

NOTE

CPMEM is "Memory Mapped" and can be accessed by the AHB bus through the Control Module (see [Memory Access Unit](#)).

The following tables describe the IDMAC parameters and their organization in each mode.

37.4.2.10.1 CPMEM's words' structure for non interleaved mode

The table below describes the CPMEM's words' structure for non interleaved mode. Each CPMEM word consist of 160 bits. The bits that are not listed in the table below are reserved bits.

Table 37-14. Channel Parameters Memory for non-interleaved

| Name | Mnemonic | Size | Location | Description |
|---------------------------|----------|---------|-----------|---|
| Word 0 | | | | |
| XV Virtual Coordinate | XV | 10 bits | W0[9:0] | Variable coordinates for determining next block address. {X1,Y1} and {X2,Y2} coordinates will be determined according to {XV,YV} upon restart of channel. These coordinates are used for Y:U:V (Y pointer) and RGB formats. |
| YV Virtual Coordinate | YV | 9 bits | W0[18:10] | |
| XB inner Block Coordinate | XB | 13 bits | W0[31:19] | Variable coordinates for determining address within the block. These coordinates are used for Y:U:V (Y pointer) and RGB formats. Need 24 bits for 2D transfer support. |
| YB inner Block Coordinate | YB | 12 bits | W0[43:32] | |
| New Sub Block | NSB_B | 1 bit | W0[44] | This bit determines if the next value for {XB,YB} should be taken from {XB,YB} saved in channel parameter memory or from new {x1,y1}/{x2,y2}. |
| Current Field | CF | 1 bit | W0[45] | CF = 0 Current field is even CF = 1 Current field is odd |
| Mem U Buffer Offset | UBO | 22 bits | W0[67:46] | Double buffer destination address offset for Y:U:V (U pointer) formats. The actual physical address value is divided by 8 (i.e. this parameter includes bits [24:3] of the actual address) |

Table continues on the next page...

Table 37-14. Channel Parameters Memory for non-interleaved (continued)

| | | | | |
|------------------------------|------|---------|-------------|---|
| Mem V Buffer Offset | VBO | 22 bits | W0[89:68] | Double buffer destination address offset for Y:U:V (V pointer) format. The actual physical address value is divided by 8 (i.e. this parameter includes bits [24:3] of the actual address) |
| Initial Offset X | IOX | 4 bits | W0[93:90] | The IOX parameter, is the offset in pixels for a frame that starts at a non aligned address. for 42x formats must be even. |
| Reduce Double Read or Writes | RDRW | 1 bits | W0[94:94] | This bit is relevant for YUV4:2:0 formats. For read channels: U and V components are not read from odd rows. (read - supported only for the VDIC) For write channels: U and V components are not written to odd rows. (write - supported for all write channels) |
| Scan Order | SO | 1 bit | W0[113] | SO = 0 Scan order is progressive SO = 1 Scan order is interlaced |
| Band Mode | BNDM | 3 bits | W0[116:114] | BNDM = 000 bands disable. BNDM = 001 bands enable. Band height = 4 lines. BNDM = 010 bands enable. Band height = 8 lines. BNDM = 011 bands enable. Band height = 16 lines. BNDM = 100 bands enable. Band height = 32 lines. BNDM = 101 bands enable. Band height = 64 lines. BNDM = 110 bands enable. Band height = 128 lines. BNDM = 111 bands enable. Band height = 256 When working in band mode, the channel's corresponding IDMAC_BNDM_EN bit has to be set. |
| Block Mode | BM | 2 bits | W0[118:117] | BM = 00 block mode disable. BW = FW, BH = FH BM = 01 block mode enable. BW = 8, BH = 8 BM = 10 block mode enable. BW = 16, BH = 16 (this mode is reserved for future use) BM = 11 not used |
| Rotation | ROT | 1 bit | W0[119] | ROT = 0 -> No rotation ROT = 1 -> 90 degree rotation clockwise |
| Horizontal Flip | HF | 1 bit | W0[120] | HF = 0 -> No flip HF = 1 -> Horizontal flip enable |
| Vertical Flip | VF | 1 bit | W0[121] | VF = 0 -> No flip VF = 1 -> Vertical flip enable |

Table 37-14. Channel Parameters Memory for non-interleaved (continued)

| | | | | |
|-------------------------|------|---------|-------------|--|
| Alpha Channel Mapping | ALBM | 2 bits | W1[92:90] | Alpha channel mapping - This parameter is a pointer to a buffer in the ATC memory. This parameter is relevant only to data channels that are associated with a separate alpha buffer (like graphic plane channels). The parameter should be programmed on the data channels' ALBM. Setting this parameter to any other channel has no meaning. See Table 37-12 for exact ALBM mapping. |
| AXI Id | ID | 2 bits | W1[94:93] | AXI protocol id |
| Threshold | TH | 7 bits | W1[101:95] | 0000000 = 32 lines 0000001 = 64 lines 1111111 = 4096 lines |
| Stride Line | SLY | 14 bits | W1[115:102] | Address vertical scaling factor in bytes for memory access. Also number of maximum bytes in the "Y" component row according to memory limitations. SLY 000000000000000 = 00001 bytes 000000000000001 = 00002 bytes 111111111111111 = 16384 bytes |
| Width3 | WID3 | 3 bits | W1[127:125] | Fourth color component size of the input-unpacking/ output-packing pixel. WID3 000 = 1 bits 001 = 2 bits 111 = 8 bits As this is a non-interleaved format, this field is relevant only to the alpha associated with this pixel channel. |
| Stride Line | SLUV | 14 bits | W1[141:128] | Address vertical scaling factor in bytes for memory access. Also number of maximum bytes in the "U" or "V" component row according to memory limitations. SLUV 000000000000000 = 00001 bytes 000000000000001 = 00002 bytes 111111111111111 = 16384 bytes |
| Conditional Read Enable | CRE | 1 bit | W1[149:149] | This bit enables the conditional read feature. |

37.4.2.10.2 CPMEM's words' structure for interleaved mode

The table below describes the CPMEM's words' structure for interleaved mode. Each CPMEM word consist of 160 bits. The bits that are not listed in the table below are reserved bits

Table 37-15. Channel Parameters Memory for interleaved

| Name | Mnemonic | Size | Location | Description |
|---------------------------|----------|---------|-----------|---|
| Word 0 | | | | |
| XV Virtual Coordinate | XV | 10 bits | W0[9:0] | Variable coordinates for determining next block address. {X1,Y1} and {X2,Y2} coordinates will be determined according to {XV,YV} upon restart of channel. These coordinates are used for Y:U:V (Y pointer) and RGB formats. |
| YV Virtual Coordinate | YV | 9 bits | W0[18:10] | |
| YB inner Block Coordinate | XB | 13 bits | W0[31:19] | Variable coordinates for determining address within the block. These coordinates are used for Y:U:V (Y pointer) and RGB formats. Need 24 bits for 2D transfer support. |
| XB inner Block Coordinate | YB | 12 bits | W0[43:32] | |
| New Sub Block | NSB_B | 1 bit | W0[44] | This bit determines if the next value for {XB,YB} should be taken from {XB,YB} saved in channel parameter memory or from new {x1,y1}/{x2,y2}. |
| Current Field | CF | 1 bit | W0[45] | CF = 0 Current field is even CF = 1 Current field is odd |
| Scroll X counter | SX | 12 bits | W0[57:46] | Holds the temporary count for the Scroll X in between frame For interleaved YUV4:2:2 formats the SX should be a multiple of 2. |
| Scroll Y counter | SY | 11 bits | W0[68:58] | Holds the temporary count for the Scroll Y in between frame |
| Number of Scroll | NS | 10 bits | W0[78:69] | This variable holds the total number of Scrolls |
| Scroll Delta X | SDX | 7 bits | W0[85:79] | Frame start row offset, compared to last frame. SDX 0000000 = 00 pixels 0000001 = 01 pixels 0000010 = 02 pixels 1111110 = 126 pixels 1111111 = 127 pixels For interleaved YUV4:2:2 formats the SDX should be a multiple of 2. |

Table continues on the next page...

Table 37-15. Channel Parameters Memory for interleaved (continued)

| | | | | |
|-----------------------------|------|---------|------------|--|
| Scroll Max | SM | 10 bits | W0[95:86] | <p>Frame maximum row and column increment offset in frame.</p> <p>SM</p> <p>0000000000 = 0001</p> <p>0000000001 = 0002</p> <p>.....</p> <p>1111111111 = 1024</p> |
| Scrolling Configuration | SCC | 1 bit | W0[96] | <p>Determines if scrolling will continue from zero when NS counter has reached SM or stop at the current value for SX and SY for the next frames to come.</p> <p>SCC</p> <p>0 => Scrolling will stop at NS = SM</p> <p>1 => Scrolling will start from "0" at NS = SM</p> |
| Scrolling Enable | SCE | 1 bit | W0[97] | <p>SCE = 0 Scrolling disable</p> <p>SCE = 1 Scrolling enable</p> |
| Scroll Delta Y | SDY | 7 bits | W0[104:98] | <p>Frame start column offset, compared to last frame.</p> <p>SDY</p> <p>0000000 = 00 pixels</p> <p>0000001 = 01 pixels</p> <p>0000010 = 02 pixels</p> <p>.....</p> <p>1111110 = 30 pixels</p> <p>1111111 = 127 pixels</p> |
| Scroll Horizontal Direction | SDRX | 1 bit | W0[105] | <p>Determines if the next frame will move right or left compared to the current frame.</p> <p>SDRX</p> <p>0 => Next frame will be right of current</p> <p>1 => Next frame will be left of current</p> |
| Scroll Vertical Direction | SDRY | 1 bit | W0[106] | <p>Determines if the next frame will move down or up compared to the current frame.</p> <p>SDRY</p> <p>0 => Next frame will be down of current</p> <p>1 => Next frame will be up of current</p> |

37.4.2.10.3 Accessing the CPMEM for programming

Each IDMAC's channel's parameters are located on 2 CPMEM entries. Each Entry is 160 bit. The CPMEM is memory mapped and is accessible via the AHB bus. The AHB bus's accesses are 32bit wide. A CPMEM entry is composed of 5x32bit words. The next CPMEM entry starts at the next 8x32bit words (0x0, 0x20, 0x40, etc.).

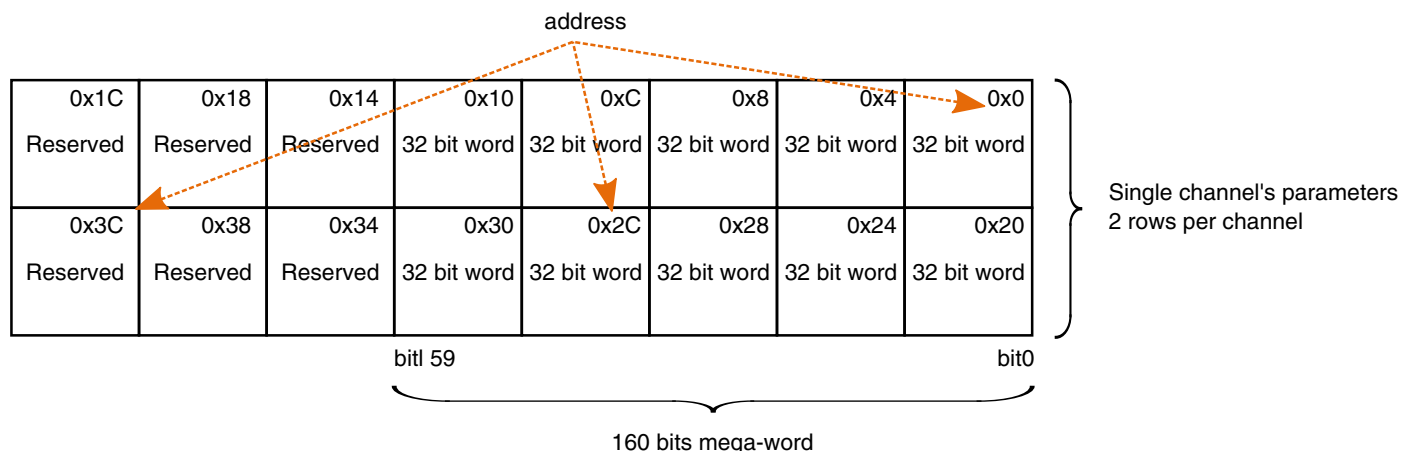

Figure 37-11. CPMEM's word structure

37.4.2.10.4 Alternate IDMAC settings

Some of the IDMAC channels support alternate flow. This means that a physical IDMAC channel can use alternate set of parameters. Switching between the flows is controlled by the CM.

The primary flow the IDMAC's settings are read from the channel's corresponding entry in the CPMEM. The alternate settings can be stored in another entry on the CPMEM. The pointer to the alternate entry on the CPMEM is stored on the physical channel's corresponding IDMAC_SUB_ADDR parameters.

37.4.2.11 IDMAC's modes of operation

37.4.2.11.1 Rotation modes

Rotation is performed by the IDMAC and the Rotation unit inside the IC.

The frame is partitioned into 8X8 pixels blocks. The IC reorders the pixels within a block. The IDMAC reorders the block. The reordering is done according to the ROT, VF & HF parameters in the CPMEM.

The following diagram illustrate various options for reordering of blocks.

- ROTATE means that the ROT bit is set
- HORIZONTAL means that the HF bit is set
- VERTICAL means that the VF bit is set

● = {X₁, Y₁} BLOCK SCAN END POINT

● = {X₂, Y₂} BLOCK SCAN START POINT

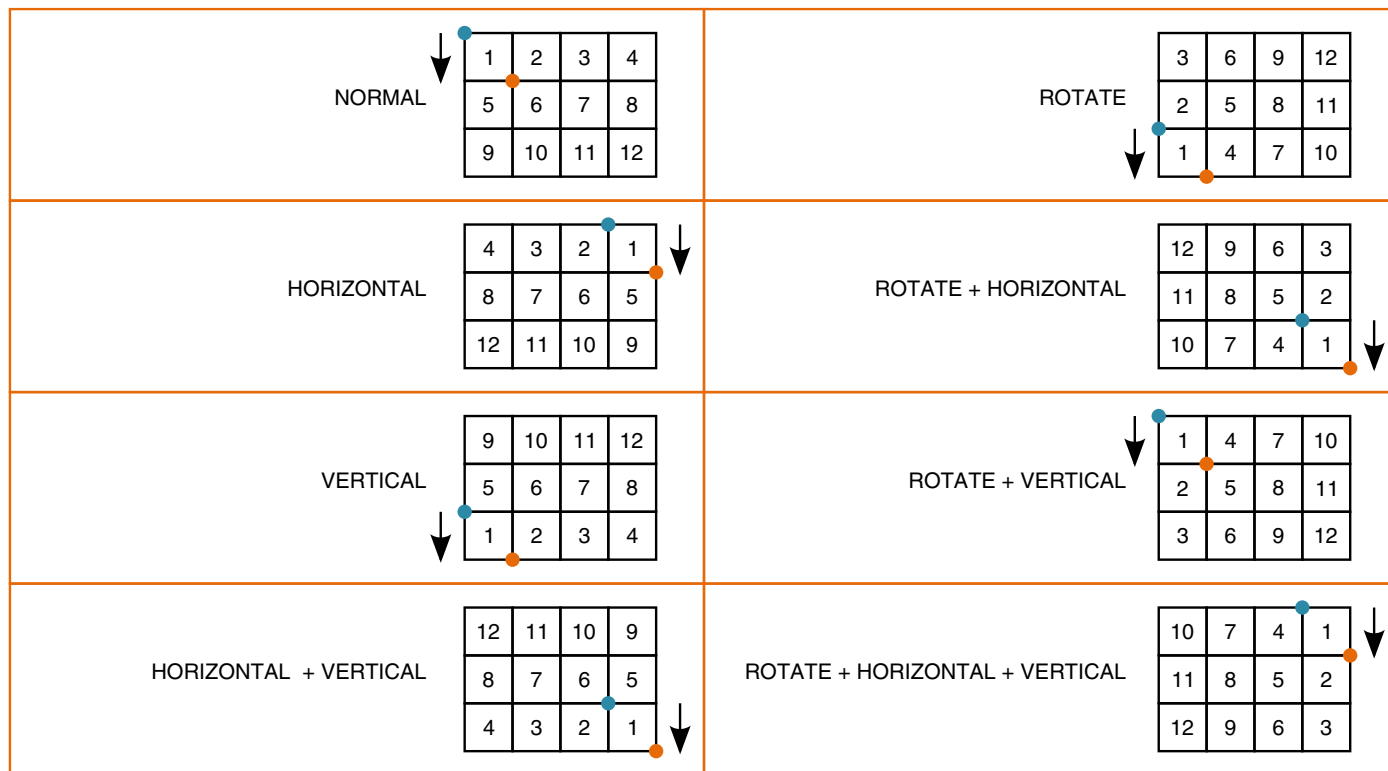

Figure 37-12. Rotation options

37.4.2.11.2 Frame size

The IPU supports various non-interleaved modes; the Frame Height (FH) and Frame Width (FW).

Figure 37-13. Frame size in various modes

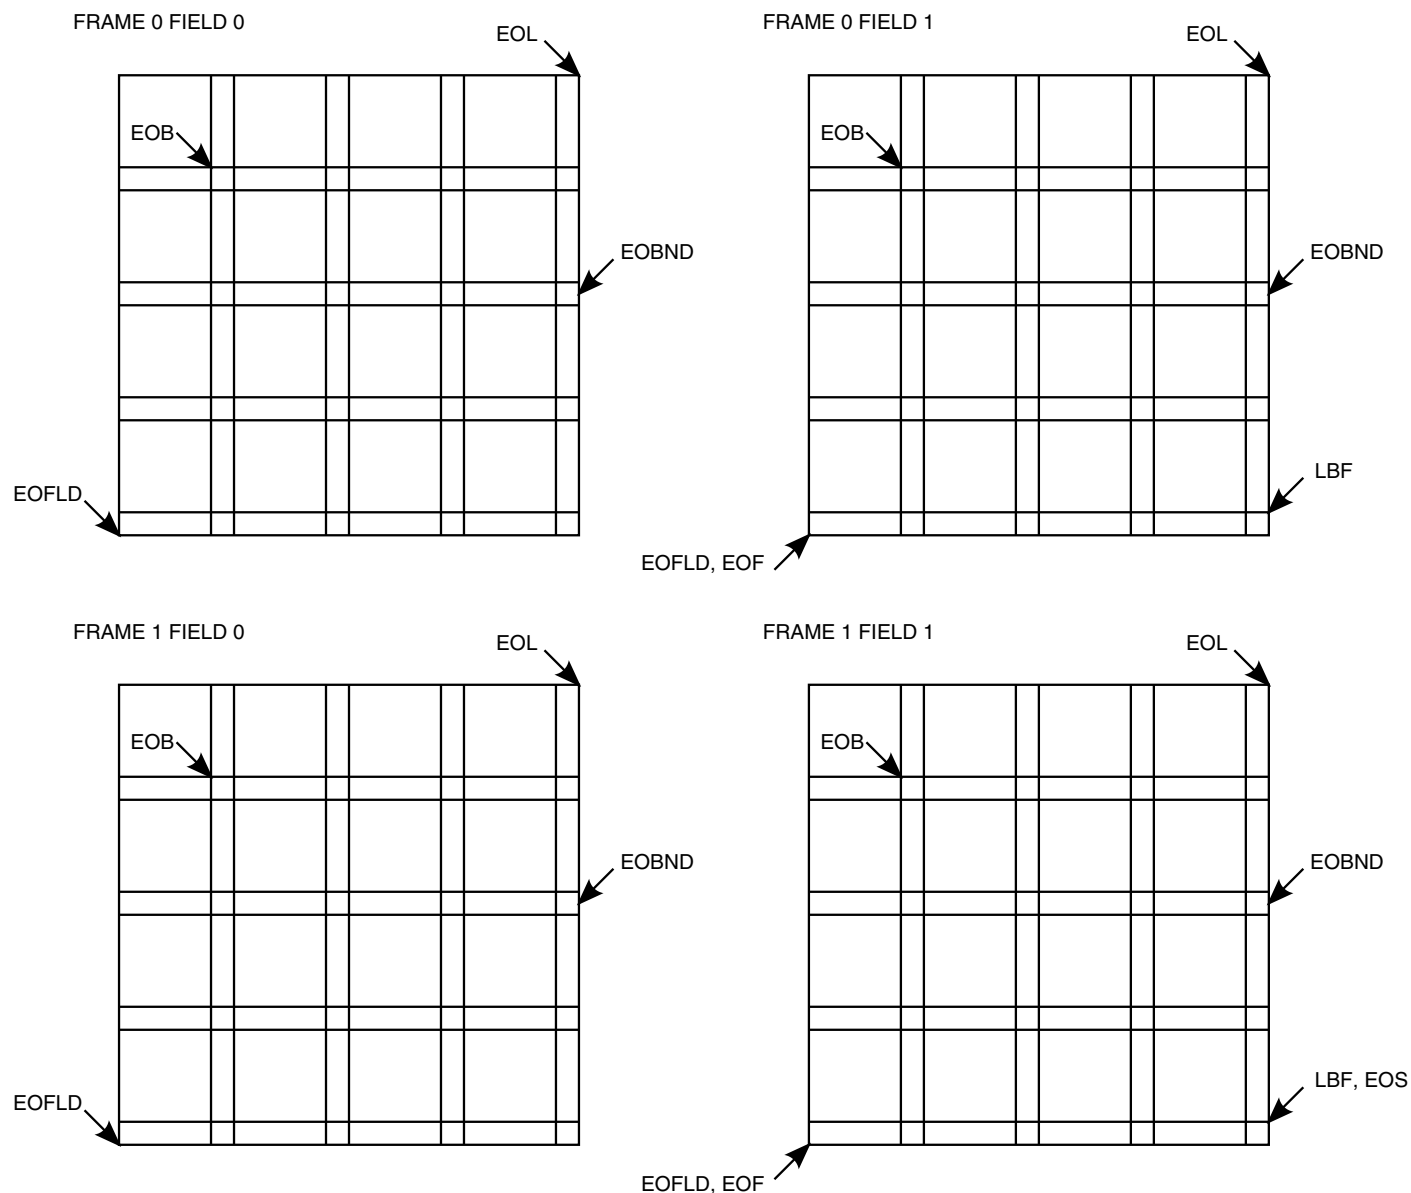

Figure 37-14. Frame's controls

37.4.2.12 IDMAC's restriction

The data must be received from the system's memory through the AXIR interface ("read" direction) "in-order" within a single burst. The entire burst can occur "out-of-order."

37.4.2.13 IDMAC's Endianness support

Byte Endianness - only LE (little endian) is supported

Pixel Endianness - both LE & BE are supported, only for read direction (only 4 BPP case is meaningful, supported only for the "read" direction)

37.4.2.14 IDMAC's internal events

Some of the IDMAC's internal signals can be used for monitor the progress of flows. These bits can be polled by software. Some of these bits can be used to trigger an interrupt or an SDMA event.

The following table describes the available events and their meaning

Table 37-16. IDMAC's internal events

| IDMAC event's type | Monitored on | Event's meaning |
|-------------------------------------|-------------------|---|
| end of frame | IDMAC_EOF | This is the channel's end of frame indication. This indication is asserted once the entire frame was read/written via the IDMAC. This indication is normally used as an interrupt or SDMA event |
| new frame acknowledge | IDMAC_NFACK | This indication means that the IDMAC acknowledge the new frame's request from the module. It can be used to track the starting point of a flow or a frame. |
| new frame before end of frame error | IDMAC_NFB4EOF_ERR | This error indication may indicate on data lost. This indication is asserted when a new frame starts before the completion of the previous frame. For example if a real time input (from camera) was not written properly to the memory due to FIFO full condition. |
| end of scroll | IDMAC_EOS | end of scroll; This indication is asserted when the scroll counter finished counting its pre defined value |
| end of band | IDMAC_EOBND | This is the end of band indication. Any time IDMAC complete reading/writing a band it will assert this indication. This is useful to manually control a flow via channels working in band mode. |
| treshold | IDMAC_TH | Threshold crossing indication. The treshold is defined according to the TH parameter in the IDMAC. |
| channel busy | IDMAC_CH_BUSY | This signal is asserted when a channel is between NFACK event to EOF event. Negation of these indications is one of the conditions for low power modes handshake. |

37.4.3 Camera Sensor Interface (CSI)

The IPU has 2 identical camera sensor interfaces (CSI). The CSI description below refers to a single CSI.

37.4.3.1 CSI Block Diagram

The CSI consists of synchronizer, interface logic, Data packing unit and Sensor Interface Control.

The CSI is controlled via the peripheral bus registers. All programming parameters for the CSI are double buffered with synchronous change at the frame start.

The CSI gets data from the sensor, synchronizes the data and the control signals to the IPU clock (HSP_CLK), and transfer it according to configuration of DATA_DEST register to one or more of the following: IC, SMFC.

This figure shows the CSI Block Diagram.

Figure 37-15. CSI Block Diagram

37.4.3.2 CSI Interface

CSI supports two types of interfaces. The interface is determined via the DATA_SOURCE register.

37.4.3.2.1 Parallel Interface

In parallel interface a single value arrives in each clock, except when working in BT.1120 mode, in which two values arrive in each cycle. Each value can be 8-16 bit wide according to configuration of DATA_WIDTH. If DATA_WIDTH is configured to N, then 20-N LSB bits are ignored.

CSI can work with several data formats according to SENS_DATA_FORMAT configuration. In case the data format is YUV, the output of the CSI is always YUV444 (even if the data arrives in YUV422 format).

The polarity of the inputs can be configured using the registers SENS_PIX_CLK_POL, DATA_POL, HSYNC_POL and VSYNC_POL.

37.4.3.2.2 High-speed serial interface - MIPI (Mobile Industry Processor Interface).

In MIPI interface two values arrive in each cycle. Each value is 8 bit wide, which means 16 MSB bits of the data bus input are treated, while 4 LSB bits are ignored.

When working in this mode, the CSI can handle up to 4 streams of data. Each stream is identified with DI (data identifier) that includes the virtual channel and the data type of this stream. Each stream that is handled is defined in registers MIPI_DI0-3. Only the main stream (MIPI_DI0) can be sent to all destination units while the other streams are sent only to the SMFC as generic data.

In this mode SENS_DATA_FORMAT and DATA_WIDTH registers are ignored, since this information is coming to the CSI via the MCT_DI bus.

37.4.3.3 Test Mode

When TEST_GEN_MODE register is configured to 1, the TEST MODE which is a debugging mode, is operated.

The CSI generates the frame by itself and sends it to one of the destination units. The sent frame is a chess board composed of black and configured color squares. The configured color is set with the registers PG_B_VALUE, PG_G_VALUE and PG_R_VALUE. The data can be sent in different frequencies according to the configuration of DIV_RATIO register.

CSI Test Mode requires the following CSIx_SENS_CONF settings:

CSIx_EXT_VSYNC = 0x1 (External VSYNC mode)

CSIx_DATA_WIDTH = 0x1 (8 bits per color)

`CSIx_SENS_DATA_FORMAT = 0x0` (Full RGB or YUV444)

`CSIx_PACK_TIGHT = 0x0`

`CSIx_SENS_PRTCL = 0x1` (Non-gated clock sensor timing/data mode)

`CSIx_SENS_PIX_CLK_POL = 0x1` Pixel clock is inverted before applied to internal circuitry

`CSIx_DATA_POL = 0x0` (Data lines are directly applied to internal circuitry.)

`CSIx_HSYNC_POL = 0x0` (HSYNC is directly applied to internal circuitry)

`CSIx_VSYNC_POL = 0x0` (VSYNC is directly applied to internal circuitry)

37.4.3.4 Sensor Image Frame Relations

The figure found here illustrates the generalized relations between image frames produced by a sensor and accepted by the CSI.

Generally, four frame definitions exist. The virtual frame A starts with the VSYNC signal. After vertical blanking starts frame B. The HSYNC signal indicates boundaries of the frame B. The frame B includes both the active sensor frame C and horizontal blanking intervals. A size of the blanking intervals depends on sensor type and programming. The size of the frame sent by the sensor (the actual pixels) has to be configured in the registers `SENS_FRM_WIDTH` and `SENS_FRM_HEIGHT`. The CSI selects a window (the frame D) inside the frame C by skipping rows and columns according to parameters defined in registers `HSC`, `VSC`, `ACT_FRM_HEIGHT` and `ACT_FRM_WIDTH`. frame D is sent to the rest of the IPU.

NOTE

The following limitation must exist:

`SENS_FRM_HEIGHT >= VSC + ACT_FRM_HEIGHT`

`SENS_FRM_WIDTH >= HSC + ACT_FRM_WIDTH`

Figure 37-16. Sensor Image Frames

37.4.3.5 Comanding

Comanding is performed as follows:

input: 10-bit unsigned number. In case that component's size is bigger than 10 bit, 10 MSB bits are taken. In case that component's size is less than 10 bit, color extraction is performed.

First step: shift:

$x \rightarrow \text{clip}(x + \text{offset}, 0, 1023)$

where the offset is a 10 bit signed number that is configured in CPD_OFFSET1 and CPD_OFFSET2 registers.

second step - piecewise-linear map:

$y = \text{Min}[255, (y1[k] + (((x - x1[k]) * \text{slope}[k]) >> 6 + 1)) >> 1]$

where:

- the input range 0..1023 is partitioned to 16 equal segments: $x1[k] \dots x1[k+1] - 1$ where $x1[k] = 0, 64, 128, 192, 256, \dots 960$.
- The linear map, in each segment, is characterized by $y1[k]$ (9-bit unsigned number) and $slope[k]$ (8-bit unsigned number).

Each destination unit can get the data after being companded depending on the configuration of CPD register. If this register is configured to 3'h0, the compander units are disable in order to save power. Parameters of the companding are equal for all destinations and can be set in the CPD registers.

2 companding units are located in the CSI. This is because when working in MIPI or BT. 1120 modes 2 components arrive in each cycle and the companding for each 2 components has to be in parallel. When CSI works in other mode, only one compander is needed, so the other one is disabled to save power.

37.4.3.6 Timing/Data mode protocols

CSI can work in several timing/data mode protocols, according to SENS_PRTCL configuration.

37.4.3.6.1 Gated Mode

In this mode VSYNC is used to indicate beginning of a frame, HSYNC is used to indicate beginning of a row. Sensor clock is ticking all the time.

Figure 37-17. gated mode

37.4.3.6.2 Non-Gated Mode

In this mode VSYNC is used to indicate beginning of a frame. Sensor clock is ticking only when data is valid. HSYNC is not used.

When working with MIPI, the non-gated mode should be configured.

Figure 37-18. non-gated mode

37.4.3.6.3 BT.656 mode

In this mode the CSI works in compliance with recommendation ITU-R BT.656. The timing reference signals (frame start, frame end, line start, line end) are embedded in the data bus input. Each timing reference signal consists of a four word sequence. The first three words are fixed and configured in the CCIR_PRECOM register. The fourth word contains information defining field, the state of field blanking and the state of line blanking. these states are configured in registers CCIR_CODE_1 (for field 0) and CCIR_CODE_2 (for field 1).

In this mode in each cycle one value of data arrives

Figure 37-19. BT.656 mode

In this diagram the first three words are 0xff, 0x00, 0x00. The fourth word is XY and it includes the timing reference.

37.4.3.6.4 BT.1120 mode

In this mode the CSI works in compliance with recommendation ITU-R BT.1120. The timing reference signals (frame start, frame end, line start, line end) are embedded in the data bus input. Each timing reference signal consists of a four word sequence. The first three words are fixed and configured in the CCIR_PRECOM register. The fourth word contains information defining field, the state of field blanking and the state of line blanking. these states are configured in registers CCIR_CODE_1 (for field 0) and CCIR_CODE_2 (for field 1).

In this mode, the CSI can also work in DDR mode - data arrives on every edge of the clock. In addition, in each cycle two value of data arrive.

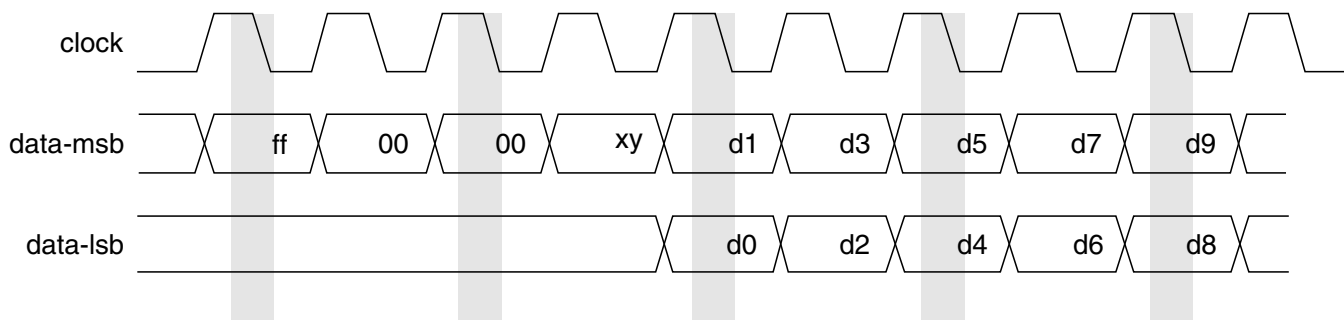

Figure 37-20. BT.1120 mode - SDR mode

In the above diagram each data arrives with the positive edge of the clock.

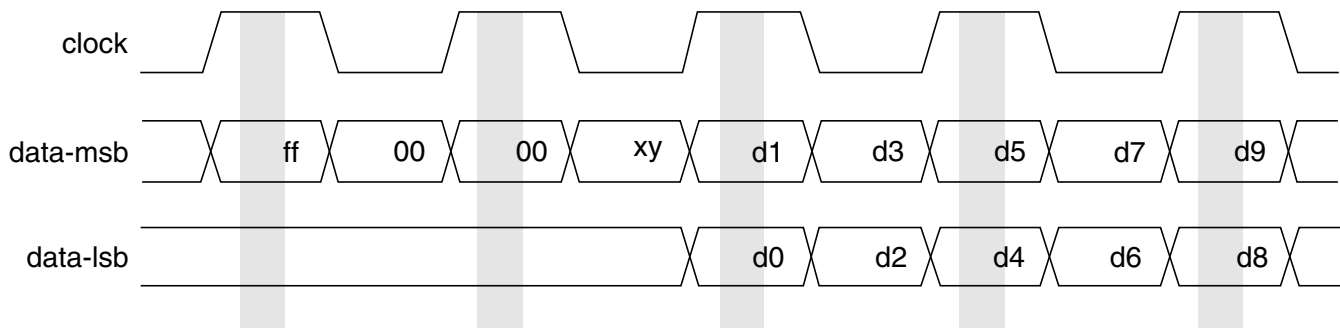

Figure 37-21. BT.1120 mode - DDR mode

In the above diagram, data arrives in the positive edge and the negative edge of the clock.

37.4.3.7 Packing to memory

The data bus output to the SMFC is 128-bit.

The following table shows the how the CSI performs the packing before sending the data to the SMFC.

The data bus output to the SMFC is 128-bit. The following table shows the how the CSI performs the packing before sending the data to the SMFC.

Table 37-17. Packing Unit

| data format | component size | companded | regular packing | tight packing |
|---------------------------|----------------|---|---------------------------------------|--------------------------------------|
| Bayer, Generic data, JPEG | 8 | {8DC ¹ , 8DC, 8DC, ..., 8DC} | {8D, 8D, 8D, ..., 8D ² } | NA |
| | 9-16 | {8DC, 8DC, 8DC, ..., 8DC} | {16DE ³ , 16DE, ..., 16DE} | NA |
| RGB, YUV | 8 | {8DC, 8DC, 8DC, 8R} | {8D, 8D, 8D, 8R} | NA |
| | 9-10 | {8DC, 8DC, 8DC, 8R} | {16DE, 16DE, 16DE, 16R ⁴ } | {10DE, 10DE, 10DE, 2R} |
| | 11-16 | {8DC, 8DC, 8DC, 8R} | {16DE, 16DE, 16DE, 16R} | {10DT ⁵ , 10DT, 10DT, 2R} |

1. DC - data after being companded
2. D - data arrived from sensor.
3. DE - data after being extended.
4. R- reserved bits
5. DT - data after being truncated.

The tight packing functionality is enabled when PACK_TIGHT register is set. It is only used when data format is RGB or YUV and the data width is bigger than 8.

37.4.3.8 Skipping frames

Some of the frames that are sent to the SMFC can be skipped. Skipped frames are ignore by the CSI and are not sent to the corresponding unit.

Using SKIP_SMFC and MAX_RATIO_SKIP_SMFC registers the user can define the frames for the SMFC that will be skipped.

37.4.3.9 16 bit camera support

Devices that support 16 bit data bus can be connected to the CSI. This can be done in one of the following ways.

16 bit YUV422

In this mode the CSI receives 2 components per cycle. The CSI is programmed to accept the data as 16 bit generic data. The captured data will be stored in the memory through the SMFC. The IDMAC needs to be programmed to store 16bit generic data. When the data is read back from the memory for further processing in the IPU it will be read as YUV422 data.

16 bit RGB as generic data

In this mode the CSI receives 3 components per cycle. If the external device is 24bit - the user can get connect a 16 bit sample of it (such as RGB565) The CSI is programmed to accept the data as 16 bit generic data. The captured data will be stored in the memory through the SMFC. The IDMAC needs to be programmed to store 16bit generic data. When the data is read back from the memory for further processing in the IPU it will be read as 16 bit RGB data. The IDMAC's mapping unit will be used to remap the 16 bit data to the internal 24bpp RGB format In this mode on the fly processing is can't be performed. The data has to be sent to the memory first and then further processed by the IPU.

16 bit RGB565

This is the only mode that allows on the fly processing of 16 bit data. In this mode the CSI is programmed to receive 16 bit generic data. In this mode the interface is restricted to be in "non-gated mode" and the CSI#_DATA_SOURCE bit has to be set If the external device is 24bit - the user can connect a 16 bit sample of it (RGB565 format). The IPU has to be configured in the same way as the case of CSI#_SENS_DATA_FORMAT=RGB565

37.4.3.10 CSI Restrictions

The frequency of the sensor clock must not be greater than the IPU clock (HSP_CLK)

$\text{SENS_FRM_HEIGHT} \geq \text{VSC} + \text{ACT_FRM_HEIGHT}$

$\text{SENS_FRM_WIDTH} \geq \text{HSC} + \text{ACT_FRM_WIDTH}$

37.4.4 Sensor Multi FIFO Controller (SMFC)

The Sensor Multifile Controller used as buffer between CSI and IDMAC. Two masters (CSIs) can be connected to SMFC. Both masters can be active simultaneously.

Each master can send up to 4 frames, distinguished by `csi_id` bus. The frame can be mapped to one of four IDMAC channels via SMFC mapping registers. Each DMA channel have dedicated FIFO.

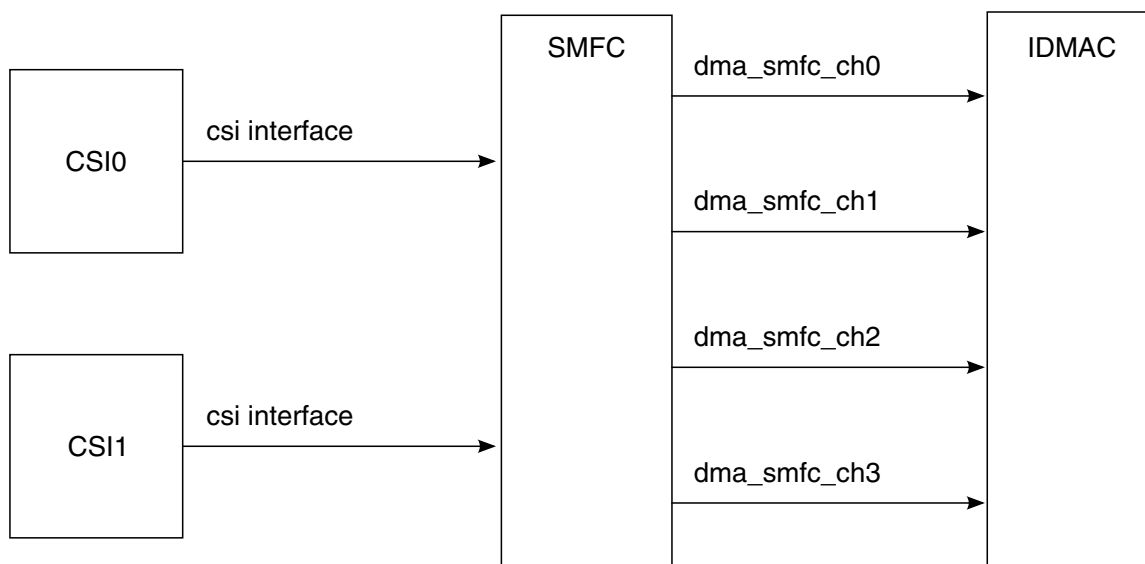

Figure 37-22. SMFC data flow

37.4.4.1 SMFC's Features

- Support two CSI masters and four DMA channels
- Automatic FIFO size calculation

37.4.4.2 SMFC's Functional description

SMFC supports up to four DMA channels. Each channel has a dedicated FIFO controller, as shown in the following figure. Sampled data and frame ID are kept in the buffers until the buffer is selected by Round Robin Priority Mechanism. Then, the content of ID buffer is compared to `CH#_MAP` bits and the corresponding FIFO controller is activated. As a result, the content of the buffer is copied to the RAM. The `wptr` and the "base" are used to calculate the location in the RAM. The `rptr` are following after `wptr` during `dma_active` signal, initiated by DMA.

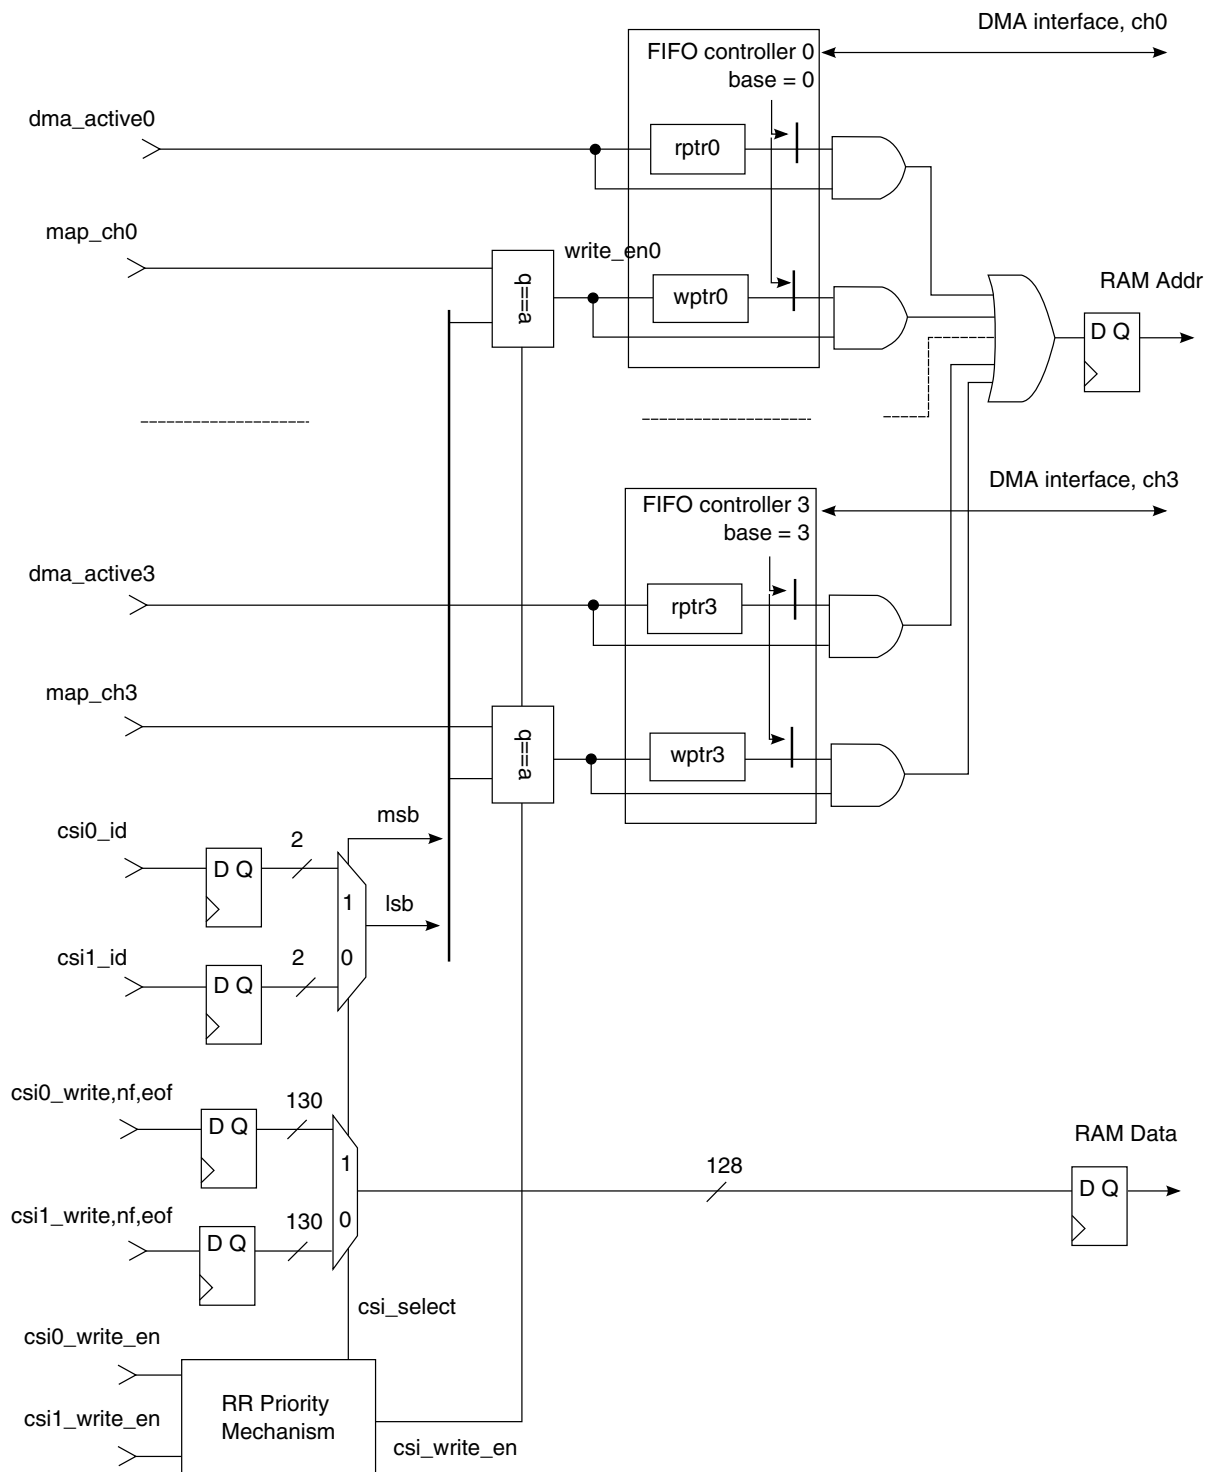

Figure 37-23. Sensor Multi FIFO Controller

Four FIFOs are implemented with single RAM due to the fact that the channels can't be active simultaneously. The memory space of SMFC is divided into four equal sectors. Each FIFO has a fixed base address - "base". The "base" used as MSB for corresponding pointer in order to calculate absolute address of the RAM. FIFO size of channels 1 and 3 are fixed and is equal to size of one sector. FIFO size of channels 0 and 2 depend from other channels as shown in the table below. Other configurations are not allowed.

Table 37-18. FIFO Channels

| Number of DMA channels required | enable/disable of channels 3,2,1,0 | FIFO size (sectors) per channels 3,2,1,0 |
|---------------------------------|------------------------------------|--|
| 1 | 0 0 0 1 | 0 0 0 4 |
| 2 | 0 1 0 1 | 0 2 0 2 |
| 3 | 1 1 0 1 | 1 1 0 2 |
| 4 | 1 1 1 1 | 1 1 1 1 |

NOTE

Channels should not be enabled after activation of channel 0 or/ and channel This can cause to overlapping of FIFO areas and other malfunctions.

Figure 37-24. SMFC memory map when DMA channels 3,2,1,0 are enabled

37.4.4.2.1 SMFC Master interface.

SMFC Master interface is shown in the following figure.

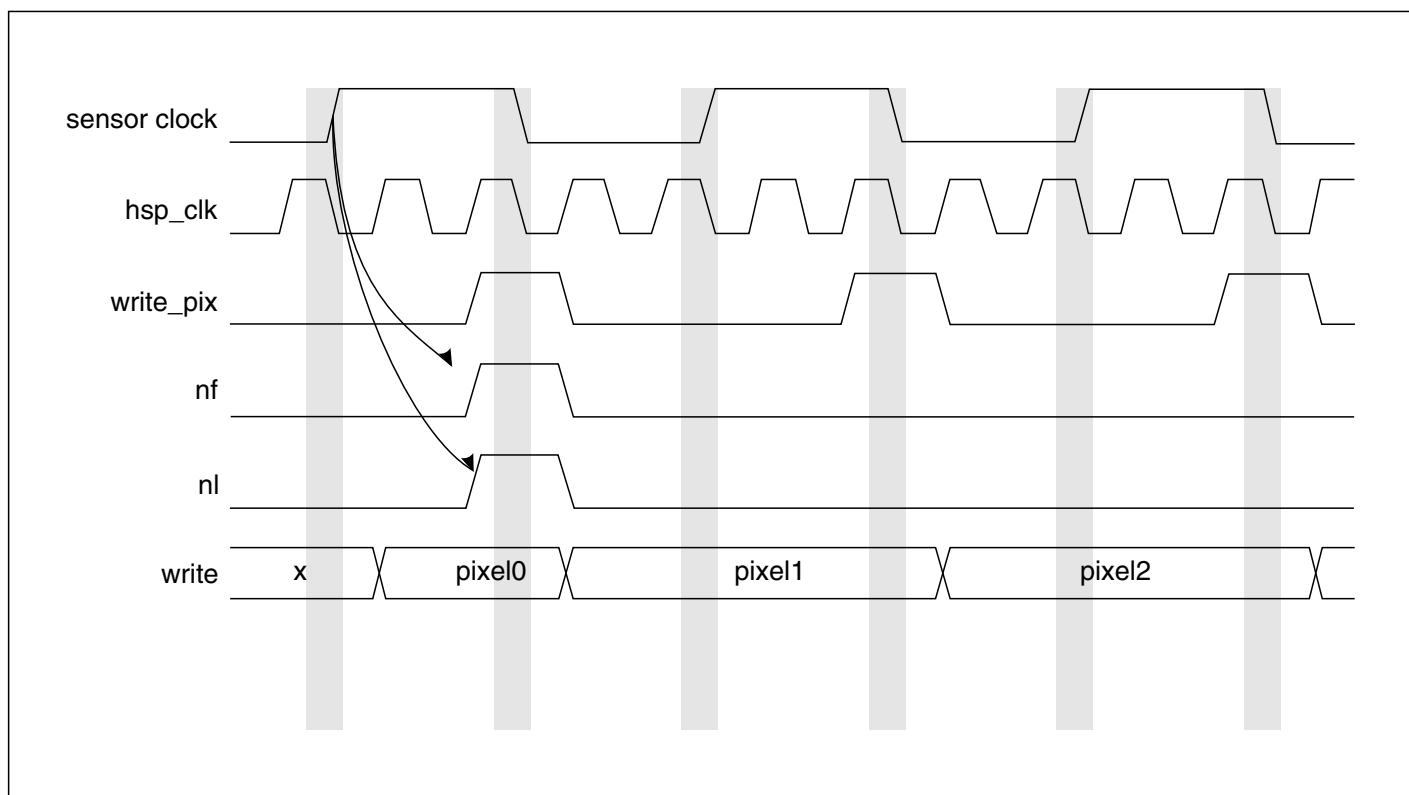

Figure 37-25. Timing diagram of SMFC slave interface

Sensor clock can be asynchronous to IPU clock (hsp_clk). The CSI synchronizes data arrived from the sensor to hsp_clk. The csi_write signal indicates when data on csi_pix bus can be sampled by hsp_clk clock.

37.4.4.2.2 Restrictions

1. DMA channels should not be enabled after activation of channel 0 or/and channel 2. This can cause overlapping of FIFO area and other malfunctions.
2. Watermark set value should be greater than watermark clear value.
3. One frame should not be mapped to few DMA channel.

37.4.5 Image Converter

37.4.5.1 IC Block Diagram

The IC contains three processing sections: downsizing, main processing and rotation.

The block is controlled via the peripheral bus registers. Some processing parameters should be written by the ARM core to the Task Parameter Memory. Writing to the memory is performed via the AHB bus.

The IC Block Diagram is shown in the following figure.

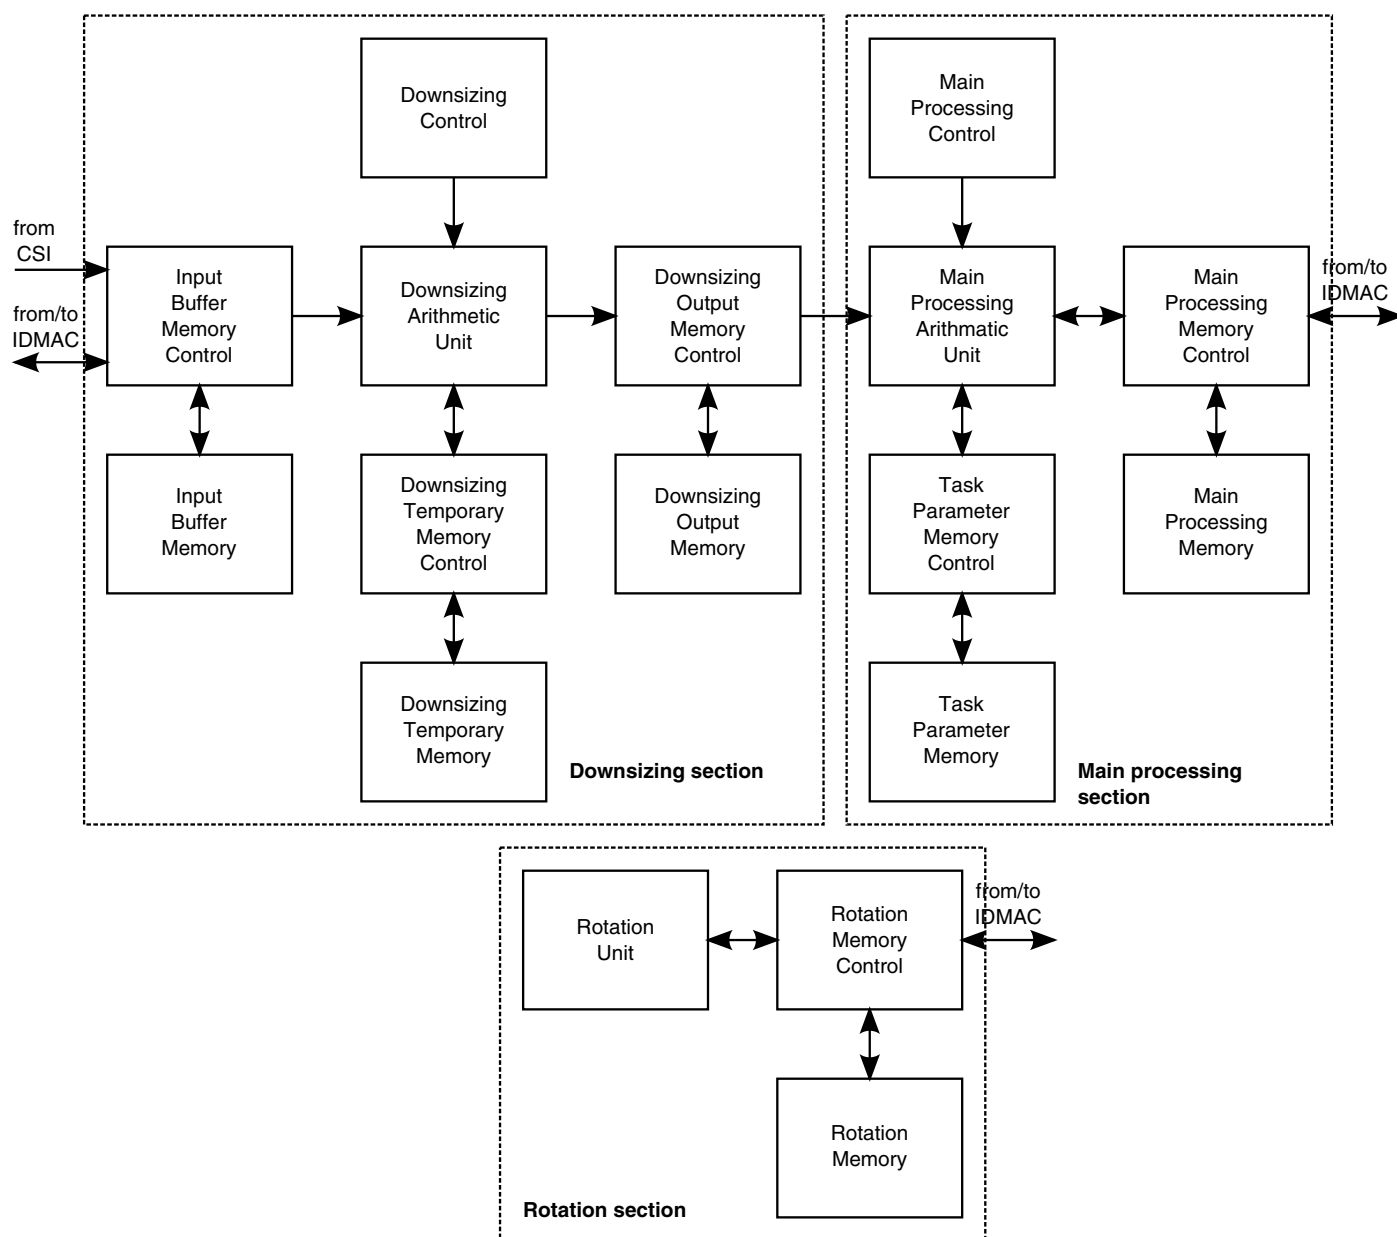

Figure 37-26. IC Block Diagram

37.4.5.2 Processing tasks

Each of the three processing sections performs up to three processing tasks with time sharing:

1. Preprocessing task for encoding.
2. Preprocessing task for displaying image from sensor (viewfinder).

3. Postprocessing task.

The tasks are performed by single hardware. The ARM platform configures each task before enabling it.

Tasks switching is transparent for the ARM platform. The time unit for task switching in the downsizing section corresponds to a processing time of one burst of eight pixels, in the main processing section - to a processing time of one image line, in the rotation section - to a processing time of one image frame.

All three tasks include similar operations controlled by commands. Task configuring consists in definition of commands for each task, as described in the following table.

Table 37-19. Task Commands

| Command code | Command | Processing unit | Command parameters | Description |
|--------------|--------------------------|-----------------|---|--|
| EN | Task Enable | DSU, MPU | | Task will enabled from next frame. Task 1 is preprocessing for encoding. Task 2 is preprocessing for viewfinder. Task 3 is postprocessing. |
| | Downsizing | DSU | Downsizing ratio (GCR) | Downsizing ratio 1:1, 2:1, 4:1 |
| | Resizing | MPU | Resizing ratio (GCR) | Resizing ratio from 2:1 to 1:M Resizing ratio = N:M; $M = 2^{13}$; $N = \text{floor}(M \cdot (SI-1)/(SO-1))$; SI - input size; SO - output size |
| CSC1 | Color space conversion 1 | MPU | Color conversion coefficients and offsets (TPM) | Color conversion matrix 1 |
| GLOB_A | Global alpha | MPU | | Used only for Task 2 and Task 3 |
| CMB | Combining | MPU | | Combining video with graphics. Used only for Task2 and Task3. |

The ARM platform writes the commands to the IC_CONF Register. Because there is no double buffering for all the IC parameters, the ARM platform must disable a task before changing its parameters. After being disabled, the task is still allowed to complete its current frame execution. At frame finish, the IPU sends an interrupt to the ARM platform indicating that the ARM platform can change task parameters. The ARM platform enables the task again and task execution is resumed from start of the next frame.

37.4.5.3 Downsizing Section

The sensor data from the CSI is written into a FIFO located in the Input Buffer Memory. Depending on programmed processing flow, the FIFO data can be sent to the system memory via the IDMAC or straight forward to the Downsizing Unit.

In the first case, the data is processed by the ARM platform and returned by the IDMAC to another FIFO located in the Input Buffer Memory.

For postprocessing, the IDMAC transfers a data from the system memory to the third FIFO. The data is read by the Downsizing Unit when the postprocessing is performed.

Each of three FIFOs has 128 pages. Each page can store one burst of 2 or 4 words which corresponds to 8 or 16 pixels. The size of the burst is defined according to the channel's corresponding CB#_BURST_SIZE bit. The memory word width is 128 bits. Each memory word contains color components of four adjacent pixels or 16 bytes of generic data (e.g. Bayer). Access to the FIFOs is controlled by the Input Buffer Memory Control.

The Downsizing Unit performs averaging and decimation of image pixels both in horizontal and vertical directions according to the following equations:

$$HP_{R,c} = \frac{1}{DS_R_H} \sum_{k=0}^{DS_R_H-1} IP_{r+k,c}$$

$$VP_{R,c} = \frac{1}{DS_R_V} \sum_{l=0}^{DS_R_V-1} HP_{R,c+l}$$

where $IP_{r,c}$ - the input pixel, $HP_{R,c}$ - the pixel after horizontal downsizing, $VP_{R,c}$ - the pixel after vertical downsizing, DS_R_H and DS_R_V - the horizontal and vertical downsizing ratios according to the IC_PRP_ENC_RSC, IC_PRP_VF_RSC and IC_PP_RSC Registers. The final calculation result is rounded to 8 bits.

Each of three downsizing tasks processes the data by bursts of 8 pixels. Normally, the current task runs until emptying the corresponding input FIFO. After finishing burst processing, the Downsizing Unit may switch between the current task and another task with higher priority, if the Input Buffer Memory has received a burst for this new task.

Averaging is performed firstly in the horizontal direction. All color components of a pixel are processed in parallel. After horizontal averaging has finished for a single output pixel, the new pixel value is added to the corresponding pixel value of a temporary row derived from previous averaging steps. This provides vertical averaging of the pixels. The temporary row is stored in the Downsizing Temporary Memory. The memory word width matches one accumulated pixel width (36 bits). There are three temporary rows stored in this memory - one per downsizing task.

After vertical averaging has been finished, the output row is written to the Downsizing Output Memory. The memory word of 48 bits includes two output pixels. For each task, the memory has a double buffer of one row. When the Downsizing Unit fills the foreground part of the double buffer, the Main Processing Unit takes pair or pixels from the background part. After the new downsized row has been ready, the foreground and background memory pointers are swapped.

37.4.5.4 Main Processing Section

The Main Processing Unit reads pairs of pixels from the Downsizing Output Memory background part. It processes the complete pixel row for the current task and after that switches to another task if the input data for this new task is ready.

For each task, the Main Processing Unit is able to perform the following sequence of operations:

1. Horizontal flipping the image (optional) performed with reading from the Downsizing Output Memory. Flipping is enabled via the VF, HF & ROT parameters of the corresponding DMA channels ([Table 37-14](#) and [Table 37-15](#)) responsible for output of the task results. The preprocessing task for encoding uses the VF, HF & ROT parameters from IDMAC channel #20, the preprocessing task for viewfinder - from the IDMAC channel #21, the postprocessing task - from the IDMAC channel #22.
2. Horizontal resizing by bilinear interpolation between two adjacent pixels received from the Downsizing Output Memory according to the equation:

$$HP_{R,c} = IP_{r,c} + RS_C_H \cdot (IP_{r+1,c} - IP_{r,c})$$

where RS_C_H - the current horizontal resizing coefficient. The calculation result is rounded to 8 bits. The resizing coefficient is calculated as

$$RS_C_H = \left(\sum_{k=0}^{R-1} RS_R_H \right) \bmod(8196)$$

where RS_R_H - the horizontal resizing ratio from the IC_PRP_ENC_RSC, IC_PRP_VF_RSC and IC_PP_RSC Registers. The RS_R_H parameter is equal to a numerator N of the resizing ratio N:M with $M = 2^{13}$.

The resulting row of the horizontal resizing is stored in the Task Parameter Memory.

3. Vertical resizing by bilinear interpolation between the current and previous results of horizontal resizing. Both current and previous results of horizontal resizing is stored in the Task Parameter Memory. Resizing is accomplished according to the equation:

$$VP_{R,C} = HP_{R,c} + RS_C_V \cdot (HP_{R,c+1} - HP_{R,c})$$

where RS_C_V - the current vertical resizing coefficient. The calculation result is rounded to 8 bits. The resizing coefficient is calculated as

$$RS_C_V = \left(\sum_{k=0}^{C-1} RS_R_V \right) \bmod(8196)$$

where RS_R_V - the horizontal resizing ratio from the IC_PRP_ENC_RSC, IC_PRP_VF_RSC and IC_PP_RSC Registers. The RS_R_V parameter is equal to a numerator N of the resizing ratio N:M with $M = 2^{13}$.

At completion of vertical resizing, this row is updated - the current result of horizontal resizing replaces the previous one.

4. First color space conversion YUV to RGB or RGB to YUV with the conversion matrix CSC1. The conversion matrix coefficients are programmable. They are stored in the Task Parameter Memory. The conversion equations are:

$$\begin{aligned} Z_0 &= 2^{\text{SCALE}-1} \cdot (X_0 \cdot C_{00} + X_1 \cdot C_{01} + X_2 \cdot C_{02} + A_0) \\ Z_1 &= 2^{\text{SCALE}-1} \cdot (X_0 \cdot C_{10} + X_1 \cdot C_{11} + X_2 \cdot C_{12} + A_1) \\ Z_2 &= 2^{\text{SCALE}-1} \cdot (X_0 \cdot C_{20} + X_1 \cdot C_{21} + X_2 \cdot C_{22} + A_2) \end{aligned}$$

where for YUV to RGB: $X_0=Y$, $X_1=U$, $X_2=V$, $Z_0=R$, $Z_1=G$, $Z_2=B$, for RGB to YUV: $X_0=R$, $X_1=G$, $X_2=B$, $Z_0=Y$, $Z_1=U$, $Z_2=V$.

All the parameters of the conversion matrix are written by the ARM platform to the Task Parameter Memory ([IC Task Parameter Memory](#)). The final calculation result is limited according to the SAT_MODE parameter and rounded to 8 bits.

5. Combining video with graphics. There are the following combining options:
- local alpha blending,
 - global alpha blending,
 - use of key color.

If both alpha blending and color keying are enabled, color keying has higher priority (graphic pixels of the key color are fully transparent independently on the alpha value).

Combining mode is selected via the IC_CONF Register. The combining equation is:

$$OP = IGP \cdot \alpha + IVP \cdot (1 - \alpha)$$

where IGP - an input graphics pixel, IVP - an input video pixel, $\alpha = (A + \text{floor}(A/128)) / 256$ - an alpha value, A - a global or local transparency parameter. The global A is written in the IC_CMBP_1 Register, the local A arrives together with the graphics pixel.

A graphics pixel becomes transparent when color keying is enabled and a pixel color matches a key color (independently on an alpha parameter).

The graphics data is read from a FIFO located in the Main Processing Memory. The FIFO contains 32 pages of size of 8 pixels. The size of the burst is defined according to the channel's corresponding CB#_BURST_SIZE bit. The graphics pixel format in the FIFO is RGB or RGBA or YUV 4:4:4 or YUVA. The graphics data is loaded by the IDMAC to the FIFO from the system memory.

All the operation are executed by an unified processing unit sequentially. Steps 1 and 2 cannot be interrupted by another task. All other steps can be interrupted by a task with higher priority if an input row is ready for this task. Preprocessing tasks priority is higher than postprocessing task priority.

The processing unit consists of three identical parts for each color component. All three color components are processed in parallel. Each of the processing operations can be enabled or disabled by an appropriate command according to.

The processing results are written to an output FIFO located in the Main Processing Output Memory row-by-row. The FIFO contains 32 pages, each page can include one burst of 8 or 16 pixels. The size of the burst is defined according to the channel's corresponding CB#_BURST_SIZE bit. The IDMAC transfers the output bursts to the system memory or to the display via DMFC (Channel 21 only). The Main Processing Memory contains three buffers for each tasks: the temporary row buffer, the graphics FIFO and the output FIFO. Each memory word (128 bits) stores 4 adjacent pixels in formats RGB or RGBA or YUV 4:4:4.

37.4.5.5 Rotation Section

The rotation section includes the Rotation Memory, which stores an input rectangular block of 8x8 pixels and an output FIFO containing four pages of 8 pixels each one. The Rotation Memory word width corresponds to four adjacent pixels - 96 bits. The input block is loaded to the memory by the IDMAC like to a FIFO.

The Rotation Unit rewrites pixels from the input block to the output FIFO with corresponding relocation of a pixel inside the block. Rotation and/or left/right flipping and/or up/down flipping are enabled separately for each of three tasks. Configuring the rotation and flipping options is performed via the VF, HF & ROT parameters of the corresponding DMA channels ([Table 37-14](#) and [Table 37-15](#)) responsible for task data input. The preprocessing task for encoding uses the VF, HF & ROT parameters from the IDMAC channel #45, the preprocessing task for viewfinder - from the IDMAC channel #46, the postprocessing task - from the IDMAC channel #47.

Rotation and flip options are shown in the following table.

Table 37-20. Rotation and Flip Options

| ROT | FLR | FUD | Image |
|-----|-----|-----|---|
| 0 | 0 | 0 |  |
| 0 | 0 | 1 |  |
| 0 | 1 | 0 |  |
| 0 | 1 | 1 |  |
| 1 | 0 | 0 |  |

Table continues on the next page...

Table 37-20. Rotation and Flip Options (continued)

| ROT | FLR | FUD | Image |
|-----|-----|-----|--|
| 1 | 0 | 1 |  |
| 1 | 1 | 0 |  |
| 1 | 1 | 1 |  |

After finishing the rotation task, the IDMAC returns the output FIFO content to the system memory. When writing to the system memory, the IDMAC changes a location of the block relative to an input block location in order to provide proper rotation of the whole frame. Rotation tasks switching is performed after completion of rotation of the whole frame.

37.4.5.6 IC Task Parameter Memory

The following table presents IC task parameter memory details.

Table 37-21. IC Parameters

| Address ¹ | Word ² | Parameter | Field | Description |
|----------------------|-------------------------------|-----------|-------|---|
| x2008 | Encoding CSC1 word0 and word1 | C22 | 8:0 | Coefficients of color conversion matrix1 for encoding task: $Z0 = X0 \cdot C00 + X1 \cdot C01 + X2 \cdot C02 + A0$; $Z1 = X0 \cdot C10 + X1 \cdot C11 + X2 \cdot C12 + A1$; $Z2 = X0 \cdot C20 + X1 \cdot C21 + X2 \cdot C22 + A2$; Coefficients format is s.xxxxxxxx ³ ; |

| | | A2 | 39:27 | Offset of color conversion matrix2 for viewfinder task: Offset format is sxx.xxxxxxxx |

1. The address documented in this table is the relative address within the TPM. This is the address that should be accessed when writing or reading from this memory via the AHB bus.
2. Each word is aligned to 64 bit accessible via the AHB bus in 2 separate 32bit accesses.
3. s - sign position, x - binary digit position

37.4.5.7 IC's DMA channels

The table below has the IDMAC channels of the IC and the IRT to the corresponding tasks.

The IC's channel name is the name of the channel at IC level. The IC channel name is referred on the IC's programming model.

Table 37-22. IC's DMA Channels

| IDMAC's channel number | IC's channel name | Read/Write | Source | Destination | Processing Flow Purpose |
|------------------------|-------------------|------------|---------|-------------|--|
| 20 | CB0 | Write | IC ENC | Memory | Preprocessing data from IC (encoding task) to memory |
| 21 | CB1 | Write | IC VF | Memory/DMFC | Preprocessing data from IC (viewfinder task) to memory; This channel can be configured to send the data directly to the DMFC. This is done by programming the ic_dmfc_sel bit. |
| 22 | CB2 | Write | IC PP | Memory | Postprocessing data from IC to memory |
| 14 | CB3 | Read | Memory | IC VF | Graphics data for combining (viewfinder task) |
| 15 | CB4 | Read | Memory | IC PP | Graphics data for combining (post-processing task) |
| 11 | CB5 | Read | Memory | IC PP | Postprocessing data from memory |
| 12 | CB6 | Read | Memory | IC VF | Preprocessing data from sensor stored in memory (for example Bayer) |
| 5 | CB7 | Write | IC | Memory | Direct data from IC (sensor data) to memory |
| 48 | CB8 | Write | ENC ROT | Memory | Preprocessing data after rotation (encoding task) |
| 49 | CB9 | Write | VF ROT | Memory | Preprocessing data after rotation (viewfinder task) |
| 45 | CB10 | Read | Memory | ENC ROT | Preprocessing data for rotation (encoding task) |
| 46 | CB11 | Read | Memory | VF ROT | Preprocessing data for rotation (viewfinder task) |
| 50 | CB12 | Write | PP ROT | Memory | Postprocessing data after rotation |
| 47 | CB13 | Read | Memory | PP ROT | Postprocessing data for rotation |

37.4.5.8 IC restrictions

- The input's frame width to the IC must be a multiplication of 8 pixels
- When performing resizing the frame width must be multiple of burst size - 8 or 16 pixels as defined by CB#_BURST_16 parameter.

37.4.5.9 IC bridge

The IC sub-block utilizes a single memory to serve read and write channels. These memories are the IBM, RM and MPM. The IDMAC has separate mechanism to handle read and write channels. As a result, a contention between read and write channels may occur on each one of the memories. In order to resolve the contention, an IC bridge sub-block is connected between the channels associated with this memory.

The bridge prioritizes a read channel over a write channel. In order to avoid starvation of the write channels, the user can limit the maximum consecutive requests of the same channel that will be served. The limitation is done by programming the memory's corresponding `<>_brdg_max_rq` field.

37.4.6 Display port

The display port handles all the IPU features targeted for controlling and sending data to the display. The display port consists of 4 modules.

DC - a display controller,

DP - a display processor,

DMFC - a display multi-FIFO controller

DI - a display interface. The DI is instantiated twice to provide two symmetrical display interfaces.

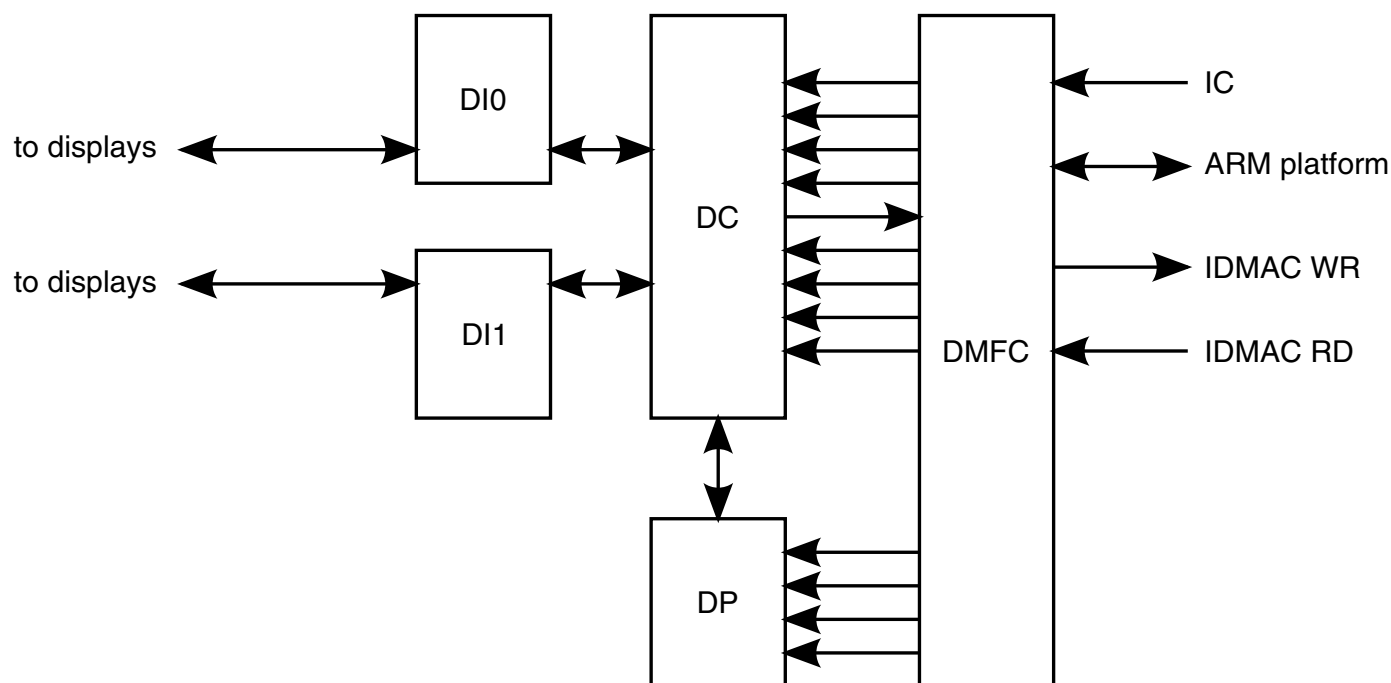

Figure 37-27. The display port

37.4.6.1 Display ports channels

The display port send data to the display over several channels. The data source may be the system's memory (via the IDMAC) the IC block and the ARM platform. The display port can read data from the display and send it to the ARM platform or IDMAC.

The data is routed over channels. The table below maps the IDMAC channels to DMFC, DC, DP channels and describes each channel.

Table 37-23. Display port channels

| IDMAC's channel number | Display port's destination | DMFC channel number | DC channel number | Corresponding alpha channel | channel usage |
|------------------------|----------------------------|------------------------------------|------------------------------------|-----------------------------|---|
| 21 | DC | Programmable using dmfc_ic_in_port | Programmable using dmfc_ic_in_port | NA | This channel is coming from the IC module. When data is coming from the IC, the IC channel replaces one of the IDMAC's channels connected to the DMFC. When the IC_DMFC_SEL bit is set the output of the IC is routed to the DMFC. This channel can be routed to the DC channels 1,2,5B,5F,6B,6F. Routing this channel to the DC channel is done with the dmfc_ic_in_port bits. The DC's channel allocated to the IC channel can't be used for data coming from other source. |

Table continues on the next page...

Table 37-23. Display port channels (continued)

| IDMAC's channel number | Display port's destination | DMFC channel number | DC channel number | Corresponding alpha channel | channel usage |
|------------------------|----------------------------|---------------------|-------------------|-----------------------------|--|
| 23 | DP | 5B | 5 | 51 | This channel is for the DP's primary flow. When a single plane is used, the data should be sent over this channel. When 2 planes are combined in this flow, the second plane should come on channel 27. |
| 24 | DP | 6B | 6 | 52 | This channel is for the DP's secondary flow. When a single plane is used, the data should be sent over this channel. When 2 planes are combined in this flow, the second plane should come on channel 29. |
| 27 | DP | 5F | 5 | 31 | This channel is for the DP's main flow. When a single plane is used, the data should be sent over channel 23 and this channel should not be used. When 2 planes are combined in this flow, one plane should come on channel 23 and the other plane on this channel. |
| 28 | DC | 1 | 1 | NA | This channel can serve sync and async flows. When channel 28 is connected to DI0, channel 23 must be connected to DI1 even if ch23 is not used. This is done by programming the PROG_DISP_ID_5 field |
| 29 | DP | 6F | 6 | 33 | This channel is for the DP's secondary flow. When a single plane is used, the data should be sent over channel 24 and this channel should not be used. When 2 planes are combined in this flow, one plane should come on channel 24 and the other plane on this channel. |
| 40 | DC | 0 | 0 | NA | This is a read channel |
| 41 | DC | 2 | 2 | NA | This channel can serve only async flow |
| 42 | DC | 1C | | NA | Command stream. See Display port's restrictions |
| 43 | DC | 2C | | NA | Command stream. See Display port's restrictions |
| 44 | DC | 3 | | NA | Mask channel. This mask channel can be associated with channel 23 or channel 28 |

37.4.6.2 Supported display interfaces

- The display port has 2 DI interfaces. Each interface can handle up to 3 displays.
- The total number of supported displays is 4.
- Each DI can handle up to 2 async interface - only one of them can be serial interface.
- Each DI can handle one synchronous interface. Asynchronous displays that are accessed in synchronous mode are considered synchronous interface.

37.4.6.2.1 Synchronous Interfaces

The DI supports the following synchronous display interfaces.

1. Synchronous generic interfaces to TFT dumb displays or RGB interfaces of smart displays.
2. Synchronous interfaces to Sharp displays.
3. Synchronous interfaces to TV encoders:
 - PAL
 - NTSC

TV interfaces can operate in progressive or interlaced modes.

4. Synchronous interface to a graphic accelerator
5. BT.656
6. BT.1120

BT.1120 and BT.656 support

BT.1120 and BT.656 are supported. Only video data is supported, sending data during blanking intervals is not supported. The component size is always 8 bit.

37.4.6.2.2 Asynchronous Parallel Interfaces

The DI has a flexible asynchronous interface. The interface include 2 chip selects (CS) and 7 general purpose control signals.

The user can decide which of the 7 signals will be associated to each one of the asynchronous displays (up to 2 displays per DI). The using can configured some of the control signals to be shared by more than one display.

37.4.6.2.3 Asynchronous Serial Interfaces

See [Serial display interface](#)

37.4.6.3 Display port's bandwidth

When the IPU clock (HSP_CLK) is equal to 264Mhz, the peak bandwidth supported by the display port is as follows

For on chip devices (like on chip MIPI-DPI bridge)

- 240 Mega-Accesses/Sec if the DI clock is derived from an external to IPU source (like another PLL)
- 264 Mega-Accesses/Sec if the DI clock is derived from the IPU clock (HSP_CLK)

For off chip devices (Like an external LCD)

- 170 Mega-Accesses/Sec if the DI clock is derived from an external to IPU source (like another PLL)
- 180 Mega-Accesses/Sec if the DI clock is derived from the IPU clock (HSP_CLK)

An access can be a pixel, component or generic data.

37.4.6.4 Display Dual Mode

This mode is useful for smart display with synchronous interface. The data is sent to the display only when the data has changed or when the display processor's settings are changed. The physical interface to this display has synchronous interface's characteristics.

37.4.6.5 Display Errors

There are a few types of errors that may impact the image sent to the display. The IPU provides some automatic mechanisms, which allow the system to overcome these errors.

37.4.6.5.1 Data starvation errors

These types of errors may happen for synchronous displays if the data is ready at the DI to be sent to the display at the time point it is required. This anomaly may happen if the system is very loaded and the IDMAC was not able to read data from the external memory and provide it to the DMFC.

Frame boundary errors

In case that a new frame should be sent to the display but the data of the previous frame was not sent completely, the IPU will reset the display modules and flush the internal buffers, as the IPU expects that the new frame indication will be triggered at least 2 lines (blanking interval) before the actual data is to be sent. The should recover and be ready with the data of the new frame within the blanking interval period.

Error within a frame

In case that a pixel was missed within a frame i.e. the pixel did not arrived to the DI on time. The IPU has 2 ways to handle the situation. The mode is selected by configuring the DI#_ERR_TREATMENT bit.

Redo the last access. The IPU will keep sending the last access to the display. The IPU will drop any pixel that arrive till the end of the line. If the data of the next line arrives correctly the IPU will continue working normally as overcame the problem. In case that the data of the next line is also incorrect the IPU will perform the same procedure as described on frame boundary errors.

Freeze the clock. In this mode, the IPU freezes the clock sent to the display till the correct data arrives. In order to avoid a case where the clock is frozen forever and the system is stuck: when the clock is frozen, a watchdog timer starts counting. When the timer completed counting the IPU will perform the same procedure as described on frame boundary errors. The number of cycles to be counted by the watchdog timer is defined according to the DI#_WATCHDOG_MODE bits.

37.4.6.5.2 Anti tearing errors

In case of anti tearing errors, the IPU indicates about the error by asserting the corresponding DC_TEARING_ERR_# bit.

See also [Antitearing control](#).

37.4.6.6 Display port's restrictions

- In case where 2 synchronous flows are used and additional asynchronous flow via DP is used. The asynchronous flow via DP can be targeted to the same DI that the synchronous flow via DP is targeted.
- There are only 2 command channels (42 and 43). Command channels are associated with data channels (24,28,41).
 - When channel 28 is associated with a command, the command stream will come from channel 42
 - When channel 41 is associated with a command, the command stream will come from channel 43
 - Channel 24 can be associated with a command stream only if channel 28 or channel 41 do not use a command stream. If channel 28 is not associated with a command stream then channel 24 can be associated with channel 42. If channel 41 is not associated with a command stream and channel 28 is associated with a command stream then channel 24 can be associated with channel 43.

- A channel that uses an alternate flow, cannot be associated with a command stream (ch. 24 or ch. 41)
- In case of a synchronous display using external clock, The DI where the synchronous display is connected to can be connected to another async display. But, it can support only the write direction. Read via the asynchronous interface cannot be performed if this DI uses external clock

37.4.7 DC - Display Controller

IPU handles few display flows supporting few displays.

The IPU's flows' data sources can be the ARM platform, the system's memory, a camera or an external device connected on the display's port such as an external graphic accelerator.

The data's destination can be any device connected on one of the DI ports.

The DC controls the flows coming to and from the DI port. The DC manages the flows, decides which flows are currently active and when each flow is activated. The arbitrates between the active flows, gets the data from the predefined source and distribute it to the correct DI.

The DC's core is the microcode. The microcode contains a set of routine. A routine is built of a set of commands stored in the template's (microcode) memory. For each event (like new frame, end of frame etc.) a specific routine is executed. The user writes the routines and map them to a specific events. The routine contains instructions to the DC about the way of handling the data/address/commands associated with the display. The routine may contain information about the data's mapping, about waveform's characteristics, and more.

The figure below shows the micro architecture diagram for the DC block

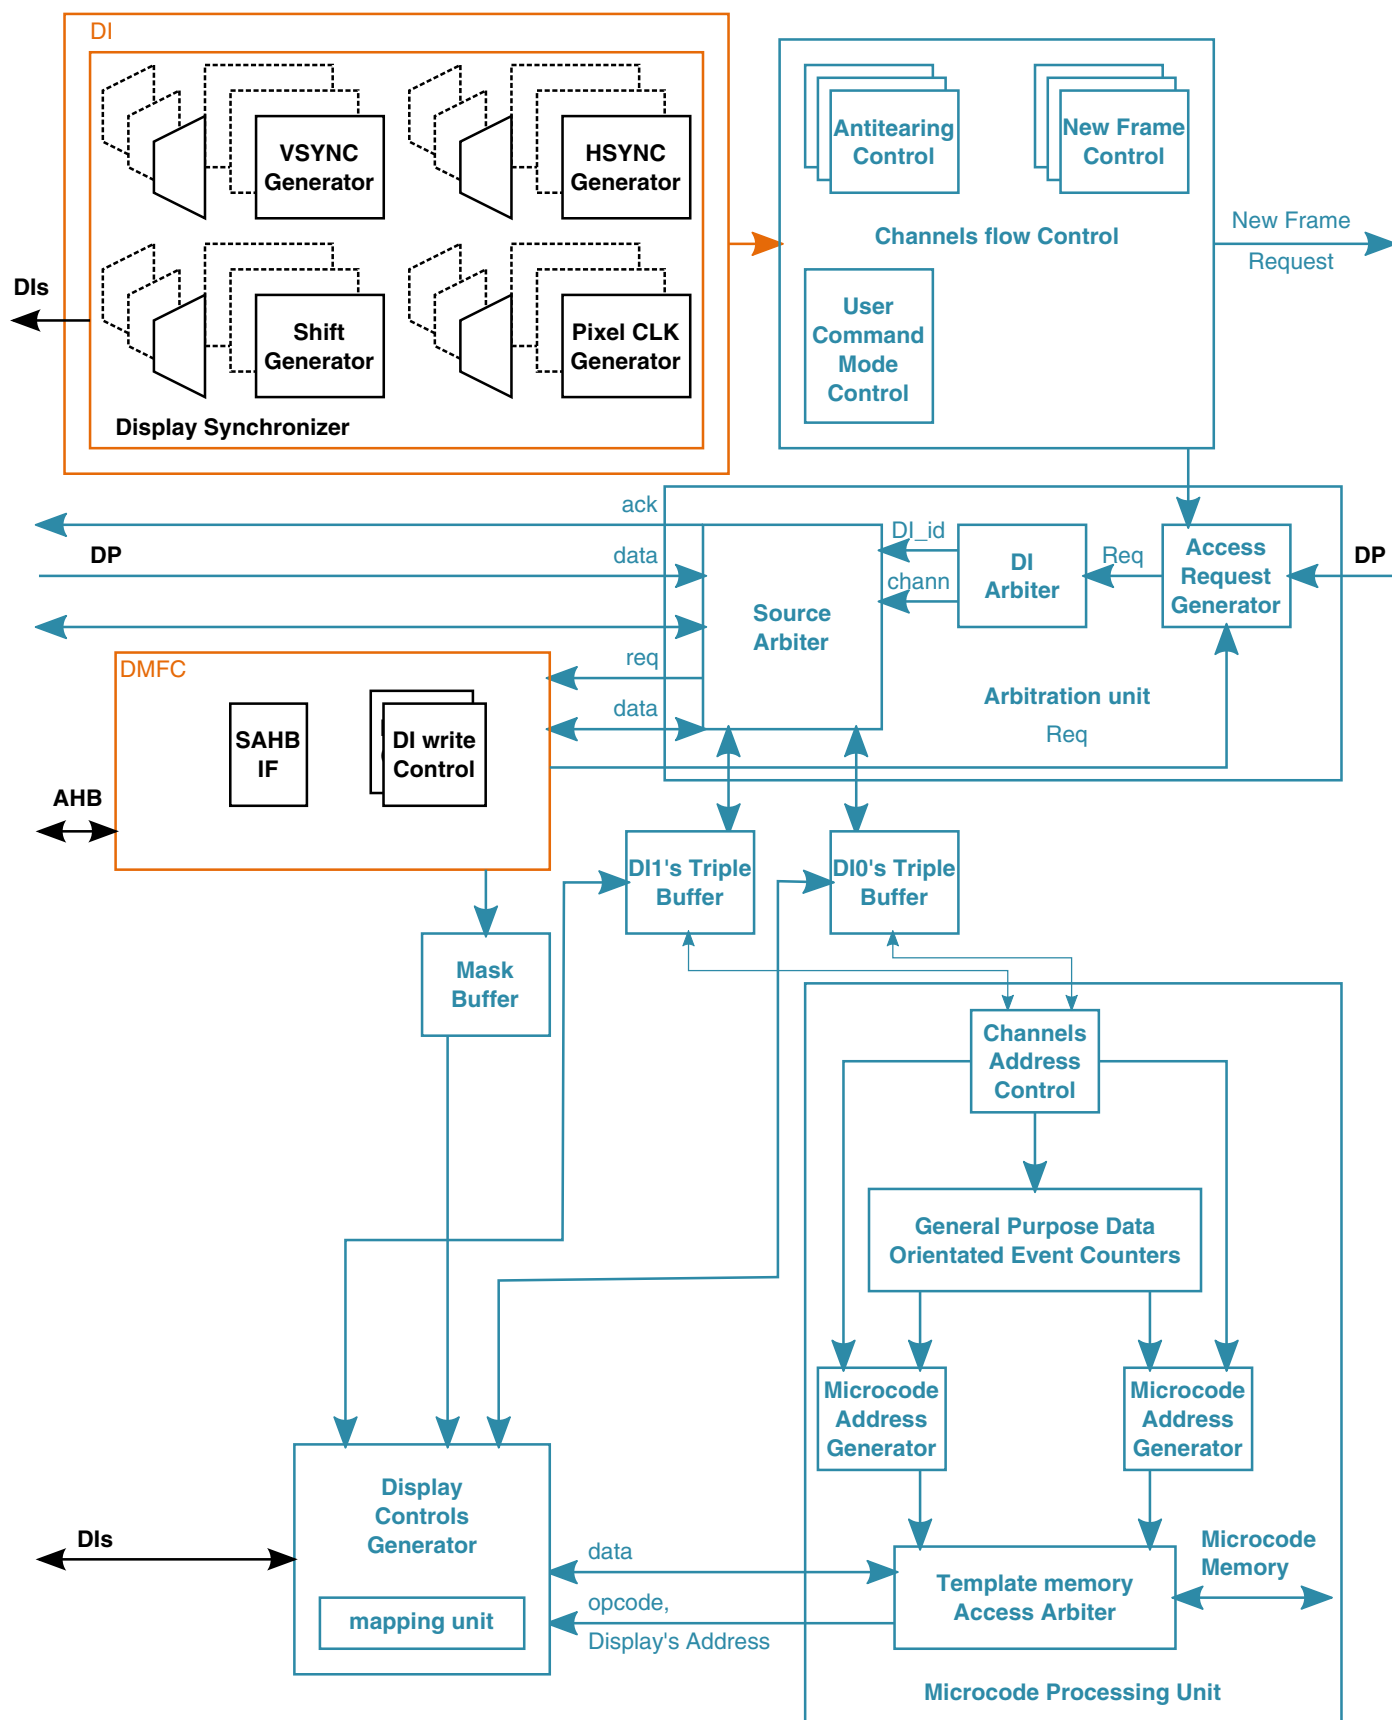

Figure 37-28. DC - Display Controller Block Diagram
i.MX 6Dual/6Quad Applications Processor Reference Manual, Rev. 1, 04/2013

37.4.7.1 Channels flow control

37.4.7.1.1 New Frame control

The channels flow control schedules the flows handled by the DC

For asynchronous flows the scheduling is done according to a request coming from the Frame Synchronization Unit (FSU) on the control sub-block (CM).

For synchronous flows the scheduling is done according to a trigger that is generated by a timer located on the one of the display's interface blocks (DI)

37.4.7.1.2 Antitearing control

Anti tearing mechanism uses a signal indicating on a display's refresh of a frame.

The supported tearing elimination triggers can be:

- An internally generated VSYNC signal
- A VSYNC signal generated by the display. The data source is the memory.
- A VSYNC signal coming from the CSI

The DC has the capability to avoid image tearing. For asynchronous flows where the source of the data is the system's memory or postprocessing, the DC monitors the position of a display's refresh pointer. Writing to the display is started only after crossing the window start point by the display refresh pointer. After that, writing to the display is allowed only when a write pointer does not advance beyond the refresh pointer. To provide anti-tearing mode, a window start time (in rows) must be defined in the `PROG_START_TIME_1`, `PROG_START_TIME_2`, `PROG_START_TIME_5`, `PROG_START_TIME_6` registers for the corresponding channels.

The antitearing mechanism is limited to a case where only asynchronous flows are handle via the target DI.

In the case when tearing cannot be avoided (when the refresh rate is too high and the refresh pointer overtakes the write pointer after full refresh cycle), an error interrupt is generated. Tearing elimination mode can be disabled via the `PROG_CHAN_TYP` field for the corresponding channel.

When the data arrives directly from the camera via IC, tearing can be avoided only for the 2:1 ratio between a sensor scan rate and a display refresh rate. The additional conditions for tearing elimination in this case are to synchronize the sensor and display VSYNCs (by programming the VSYNC's settings on the DI) and full-screen image from the camera via IC channel.

37.4.7.1.3 User command mode control

A user may prepare in the system's memory a buffer that holds commends to be sent to the external device. The command buffer includes the same amount of lines as the data buffer. The line of commands are sent to the display line by line. A line of data is sent following each line of commands. This mode is activated by programming the PROG_CHAN_TYP of the corresponding channel.

The structure of the command is as follows:

Figure 37-29. Structure of a command word

37.4.7.2 Arbitration Unit

This unit arbitrates the requests coming from the DMFC and from the DP and sends them to corresponding DI.

37.4.7.2.1 Access request generator

The requests coming from the DMFC or DP are sorted according to the target DI and then served according to a hard coded priority. The priority order is Sync flow, ARM platform access, IDMAC's Async flows.

37.4.7.2.2 DI arbiter

This units arbitrates between the DIs. The priority is hard coded. The priority order is Sync flow, ARM platform access, IDMAC's Async flows.

In case of 2 simultaneous requests to different DIs with the same priority the requests are served in a Round-Robin fashion. In case of 2 simultaneous Sync flow requests to different DI, the user can bypass the Round Robin mechanism and prioritize one DI on the other according to the SYNC_PRIORITY_1 & SYNC_PRIORITY_5 bits. Setting low priority to both of these channels is forbidden.

37.4.7.2.3 Source arbiter

Once the source of the request to be served was selected and the target DI was chosen, this unit routes the request and all the signals, associated with it, to the correct triple buffer and to the correct source of the data.

37.4.7.3 Microcode processing unit

The main control unit of the DC is the Microcode processing unit (MPU).

The data coming to the DC may be associated with some additional information like new frame, new line, new address etc. The information is processed in the MPU. The MPU executes the associated routine. The routine includes a set of instructions of the actions to be performed by the DC and DI.

37.4.7.3.1 Channels address control

This unit controls the display's address for each channel. This unit is responsible for defining the next address to be accessed (by incrementing or jumping). Stores special events flags (like EOF, EOL etc.). Based on the display's address and the special events, the type of the routines to be executed is defined.

37.4.7.3.2 General purpose Data oriented events counters

A user may define up to 4 general purpose events. The events are triggered by a standard event (NF, NL). The standard event restarts a counter, when the counter completes counting the user's general purpose event is asserted. This event activates a routine like any other events

37.4.7.3.3 Microcode address generator

This unit calculates the physical address of the template memory where the event associated routine resides. In addition, these unit arbitrates between simultaneous events and select the event to be served.

The arbitration is done according to a user defined priority. The priority of each event is set according to the #_CHAN_PRIORITY_CHAN_# bits of each channel. There are 2 modes of arbitration:

- Serving all the pending events according to the priority
- Serving only the highest priority event while ignoring all the other events

The arbitration mode is defined according to the CHAN_MASK_DEFAULT bit of each channel.

37.4.7.3.4 Template's Memory Access Arbiter

This unit gets memory access requests from the 2 microcode address generator units and arbitrates between them in a Round Robin fashion. In case that only one of the requests belongs to a synchronous flow, this request is selected.

37.4.7.4 DC's Template structure

The template memory contains 256 template words. Each template word is a 42 bits words. Accessing a template word require 2 accesses (32bit each).

Table 37-25. DC template's fields description (continued)

| Field | Description |
|-----------|--|
| GLUELOGIC | <p>For signals generated by waveform generator #3; This field provides extra flexibility on the signals waveform</p> <p>GLUELOGIC[6] - This bit defines if we are in clock mode (1) or CS mode(0).</p> <p>1- clock mode</p> <p>When the command is related to the display clock's pin then only if we are in clock mode, GLUELOGIC[5:4] are valid.</p> <p>0- CS mode</p> <p>When the command is related to the CS pin then only if we are in CS mode, GLUELOGIC[3:0] are valid.</p> <p>GLUELOGIC[5:4] - clock mode settings</p> <p>00 - Freeze the display clock following the execution of the current command</p> <p>01 - Freeze the display clock before the execution of the next command to be executed</p> <p>10 - Enable (unfreeze) the display clock following the execution of the current command</p> <p>11 - Enable (unfreeze) the display clock before the execution of the next command to be executed</p> <p>GLUELOGIC[3] - CS mode settings</p> <p>1 - Once the signal is asserted then it remains asserted (high or low according to the polarity)</p> <p>0 - No impact on the waveform</p> <p>GLUELOGIC[2] - CS mode settings</p> <p>1 - Once the signal is negated then it remains negated (high or low according to the polarity)</p> <p>0 - No impact on the waveform</p> <p>GLUELOGIC[1] - CS mode settings</p> <p>1- The current waveform can be attached to the previous waveform. If the previous waveform was asserted and the current waveform start asserted the two waveforms will be attached so the signals' waveforms will be consecutive. This impact the behavior of the previous waveform. This can be done only if GLUELOGIC[0] of the previous waveform is set to 1</p> <p>0 - No impact on the waveform</p> <p>GLUELOGIC[0] - CS mode settings</p> <p>1 - this bit allows the next waveform to be attached to the current waveform.</p> |
| SYNC | <p>The data associated with this command should be synchronized to the DI's one of gen_time_sync generators' output.</p> <p>0000 - No sync. The data is sent without any synchronization to any event</p> <p>0001 - Sync with unit #1</p> <p>0010 - Sync with unit #2</p> <p>...</p> <p>1010 - Sync with unit #10</p> <p>1011 - 1111 Reserved</p> |

DC template's command description

Functional Description

The diagram below illustrates the command processing flow. The command is being fetched from the microcode memory. The Opcode is decoded. According to the decoding several controls are sent to the processing unit. In addition the processing unit gets the pixel's data and the display's address. The processed data/ address is stored in an internal register. There are 2 types of commands

HOLD - In this type of commands the data/address is stored in the register and not sent to the DI. The data/address is held in the register for further processing in the following commands.

WRITE - In this type of commands the data/address is stored in the register and also sent to the DI.

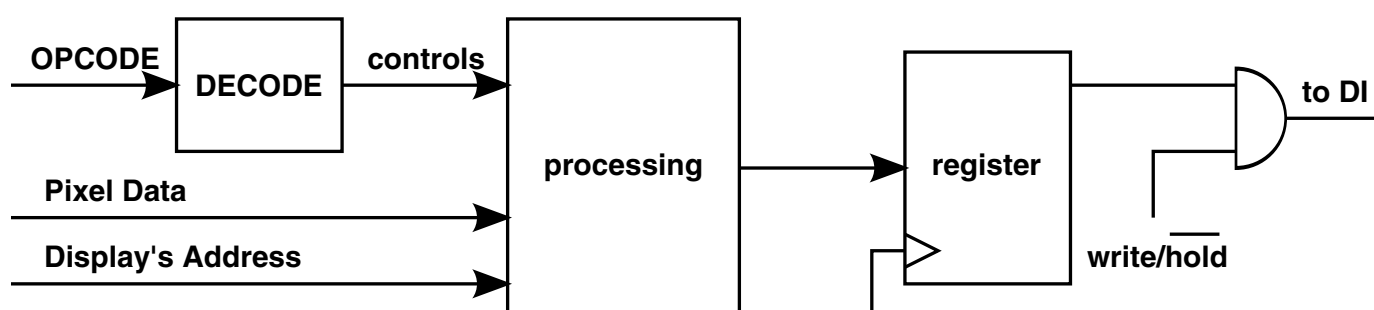

Figure 37-31. Opcode processing

The table below describes the DC's Commands.

Table 37-26. DC template's commands description

| HOLD_MICROCODE_ADDRESS - hold operand in special Microcode address register 1. This register is used to store a pointer in the microcode to be used by the BMA command ADDRESS is a microcode address in the microcode memory defined by the user. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | 4 1 | 4 0 | 3 9 | 3 8 | 3 7 | 3 6 | 3 5 | 3 4 | 3 3 | 3 2 | 3 1 | 2 0 | 2 9 | 2 8 | 2 7 | 2 6 | 2 5 | 2 4 | 2 3 | 2 2 | 2 1 | 0 9 | 1 8 | 1 7 | 1 6 | 1 5 | 1 4 | 1 3 | 1 2 | 1 1 | 1 0 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |
| BMA | S | 0 | 0 | 0 | 1 | 1 | L F | A F | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | N | | | | | | | | 0 | 0 | SYNC | | |
| BRANCH_MICROCODE_ADDRESS jump to Microcode address which is stored at an internal Microcode address register. The branch will be done to the ADDRESS stored with the HMA/HMA1 command. The BMA command manages the repeat cycles by one of the auto decrement counters (internal counters), the counter's id is defined by LF-bit (0/1) The N operand defines the N-number of routine's repetitions. In case of N=0. The BMA command functions as a JUMP command. As long as the internal counter didn't reached its predefined value, the microcode will branch to the pre defined address stored by the HMA/HMA1 commands. Selecting between HMA and HMA1 is done by the AF bit (it is calculated according to the "1 - AF" value). - That's the subroutine's microcode start address When the counter reached its predefined value, the microcode will branch to the pre defined address stored by the HMA/HMA1 commands. Selecting between HMA and HMA1 is done by the AF bit (it is calculated according to the "AF" value). - That's the subroutine's microcode return address BMA synchronization (SYNC field): The BMA command can be used for context switching between 2-channels. When switching between flows the user can run a routine for a new channel, which actually affects the previous flow. This feature is useful when a new flow breaks the current flow (post command for example): SYNC is used for display_id selection // 0 0 0 - current display // 0 0 1 - previous display // 1 0 0 - display 0 // 1 0 1 - display 1 // 1 1 0 - display 2 // 1 1 1 - display 3 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

37.4.7.5 Display controls' generator

This unit generates the control signals associated with the data that are sent to the DI block.

37.4.7.5.1 Bus Mapping Unit

The Bus Mapping Unit is responsible for programmable mapping of the input data and commands to the display interface format and vice versa. Address mapping is done by this unit as well (programmable via micro code).

The internal DI format for data and commands is a 24-bits word divided into three byte components (eight zeroes are added to MSB for 16-bits words from the DC). This word can be output or input in one, two, three or four cycles of the display clock.

The word coming from the memory is a 32bit word. The mapping operation is done on 24 bits only. The 24 bit are selected from the received 32 bit according to the `W_SIZE_#` field. The 24 bit input word is partitioned to a 3 bytes (3X8bits). Each byte can be mapped to any position at the 24bit output word. The exact position is set according to the `MD_MASK` & `MD_OFFSET` fields.

The `MAPPING_PNTR_BYTE0_X`, `MAPPING_PNTR_BYTE1_X`, `MAPPING_PNTR_BYTE2_X` fields holds the pointers for the `MD_MASK` & `MD_OFFSET` for each byte.

The `MAPPING` field holds a pointer to a register holding 3 fields:
`MAPPING_PNTR_BYTE0_X`, `MAPPING_PNTR_BYTE1_X`,
`MAPPING_PNTR_BYTE2_X`.

0 - no mapping i.e. 32 bits are sent as is.

1 - points to `MAPPING_PNTR_BYTE0_0`, `MAPPING_PNTR_BYTE1_0`,
`MAPPING_PNTR_BYTE2_0`

2 - points to `MAPPING_PNTR_BYTE0_1`, `MAPPING_PNTR_BYTE1_1`,
`MAPPING_PNTR_BYTE2_1`

...

30 - points to `MAPPING_PNTR_BYTE0_29`, `MAPPING_PNTR_BYTE1_29`,
`MAPPING_PNTR_BYTE2_29`

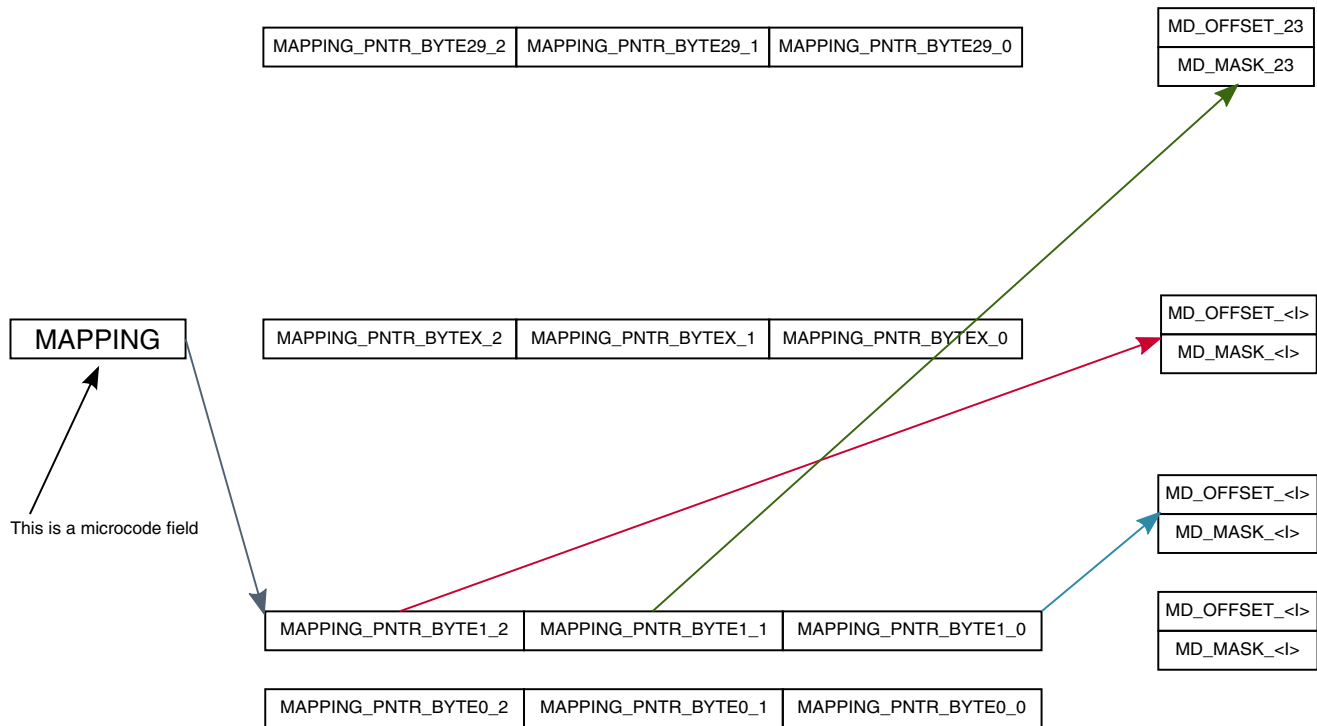

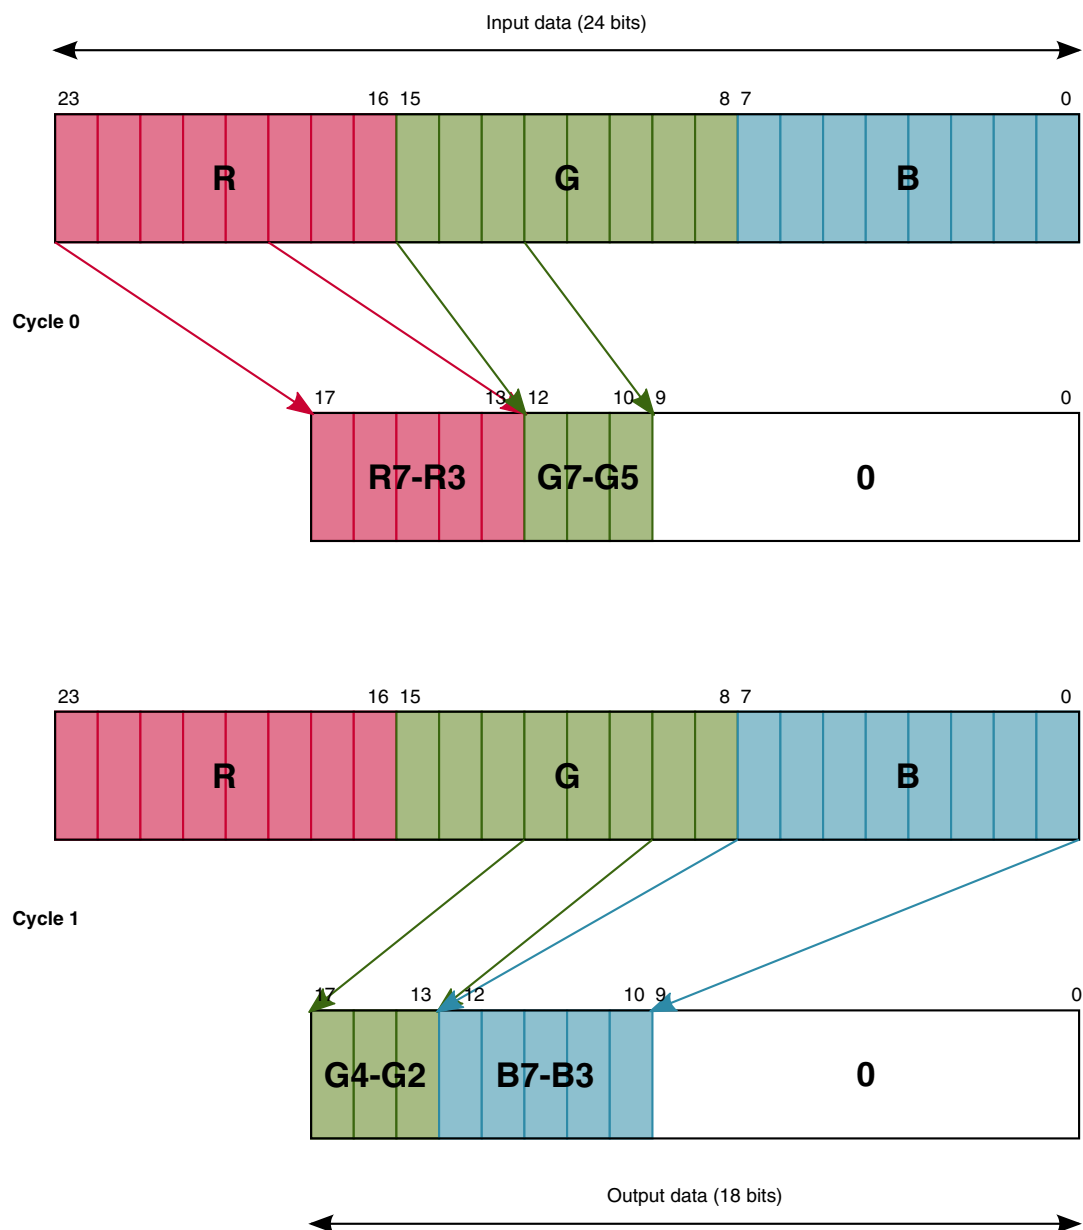

Figure 37-32. Mapping scheme

The mapping rule written in each of the Registers defines two types of parameters for the specific byte component and display:

1. Offsets of the byte component MSB relative to the output word LSB. Because the offsets can change dynamically, they are defined separately for the display clock cycles zero, one and two.
2. Numbers of the display clock cycles at which every bit of the byte component should be valid on the display bus. There are eight such 2-bit numbers in the Register.

Figure 37-33 presents an example of programming data packing for one of displays. Cycle 0 and Cycle1 in the diagram represent two separate atomic operations performed by the microcode template.

Functional Description

Cycle 0

MD_OFFSET_[R] - 0x11; MD_MASK_[R] - 0xF8

MD_OFFSET_[G] - 0xC; MD_MASK_[G] - 0xE0

MD_OFFSET[B] = 0x0; MD_MASK_[B] = 0x0

Cycle 1

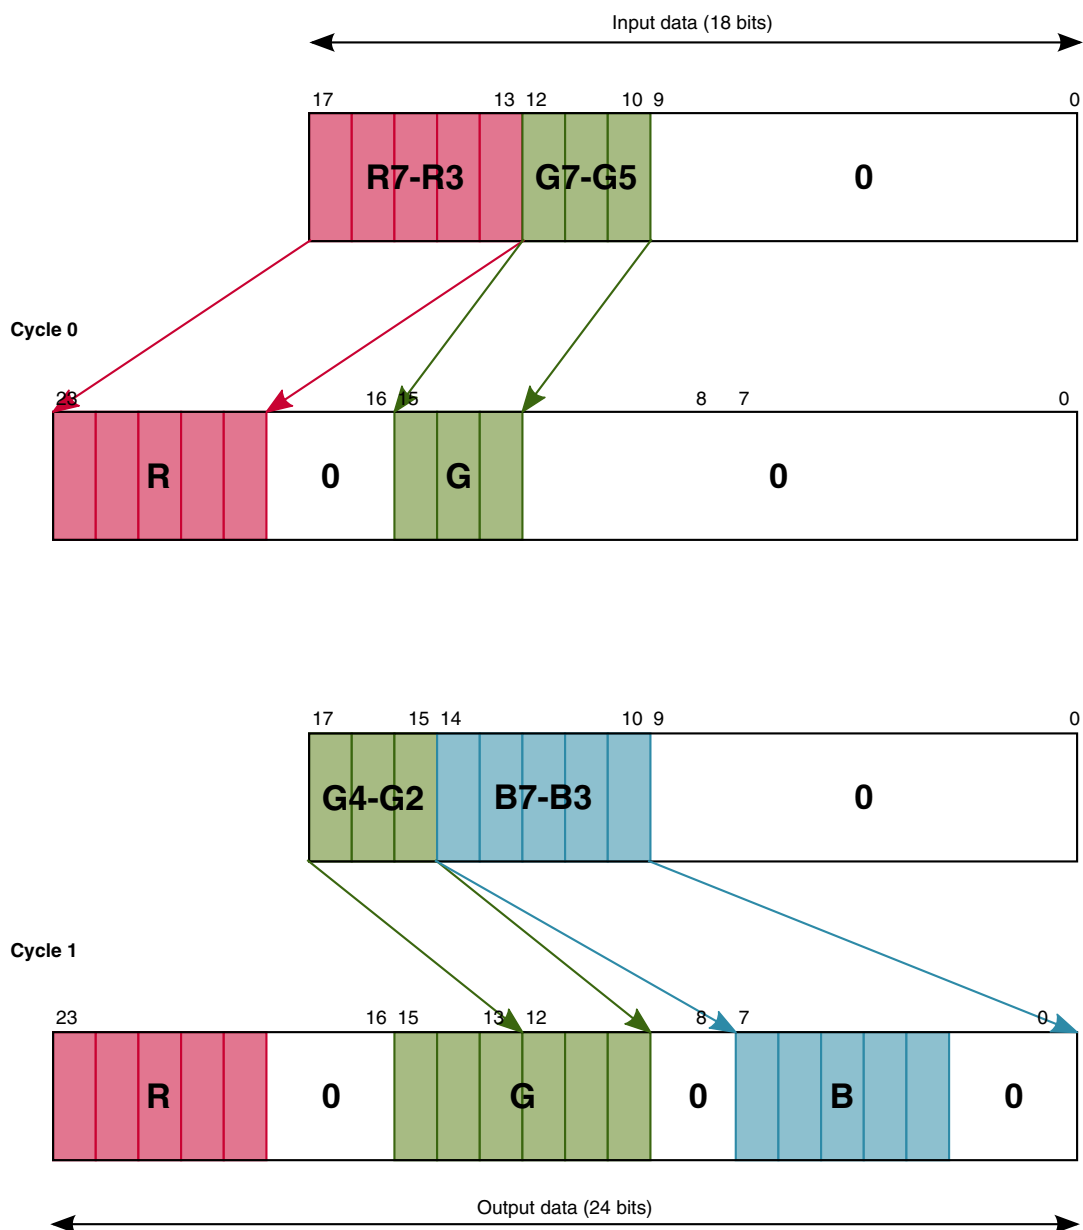

MD_OFFSET_[R] = 0x0; MD_MASK_[R] = 0x0

MD_OFFSET_[G] = 0x14; MD_MASK_[G] = 0x1C

MD_OFFSET_[B] = 0xE; MD_MASK_[B] = 0xF8

Figure 37-33. Example of Data Packing for Writing Data to the Display

The following figure presents an example of programming data packing for one of displays. Cycle 0 and Cycle1 in the diagram represent two separate atomic operations performed by the microcode template.

Cycle 0

MD_OFFSET_[R] - 0x11; MD_MASK_[R] - 0xF8

MD_OFFSET_[G] - 0xC; MD_MASK_[G] - 0xE0

MD_OFFSET[B] = 0x0; MD_MASK_[B] = 0x0

Cycle 1

MD_OFFSET_[R] = 0x0; MD_MASK_[R] = 0x0

MD_OFFSET_[G] = 0x14; MD_MASK_[G] = 0x1C

MD_OFFSET_[B] = 0xE; MD_MASK_[B] = 0xF8

Figure 37-34. Example of Data Unpacking for Reading Data from the Display

The same packing/unpacking registers are used for parallel and serial interface.

37.4.8 DMFC - Display Multi FIFO Controller

The following figure shows the block diagram for the DMFC block.

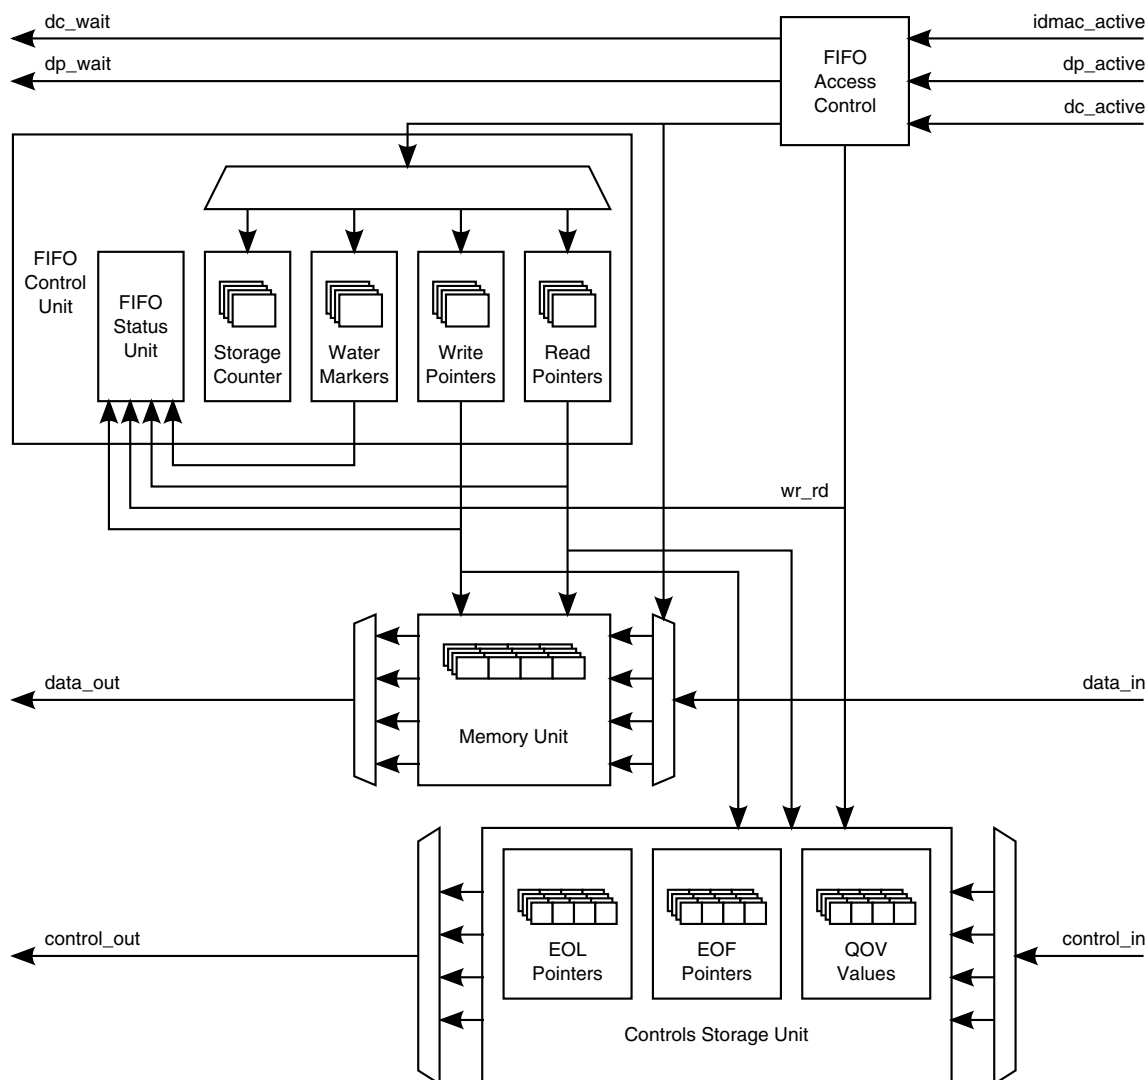

Figure 37-35. Display Multi Fifo Controller Block Diagram

The Display Multi Fifo Control manages Multi channels FIFOs. The DMFC serves the following clients:

- IDMAC - both read and write
- DP - read only
- DC - both read and write

- IC - write only
- AHB - both read and write

The DP and the DC read channels are physically attached to an IDMAC or an IC channel. As the IC has only one output channel connected to the DMFC. When the input is coming from the IC it replaces a channel that was physically attached to the IDMAC. The DMFC uses a single physical memory that serves the DP and DC read channels. The AHB accesses to the DC and the DC's write channel (read from display) use a separate physical memory.

The DMFC's write FIFO is built of 1024 entries of 128-bits each.

37.4.8.1 DP and DC read channels

Each one of the DP and the DC read (read from memory) channels is physically attached to an IDMAC read channel. A portion of the physical memory is allocated for each channel. The DMFC arbitrates between channels according to a predefined priority.

The DMFC controls each of the FIFOs

- Assert a request any time there's available place on the FIFO.
- Make sure that there's available place on the FIFO to accept the coming data.
- Optionally assert a watermark indication to avoid starvation

37.4.8.1.1 FIFO allocation to channels

The physical memory is partitioned to 8 segments. For each channel the user has to define the start address at a segment's boundary using the DMFC_ST_ADDR parameter.

The size of the FIFO allocated to a channel is defined by the DMFC_FIFO_SIZE parameter. The user must allocate the FIFO and avoid overlapping between FIFOs.

The DMFC hold few special indications like EOF, EOL, EOFILD. The most important one is end of line (EOL). If the size of the FIFO is shorter than or equal to the IDMAC line's length (FW) than no special restrictions on the DMFC usage.

If the size of the FIFO is greater than the IDMAC line's length (FW) than the user has to be aware to the following restriction for each channel.

The DMFC has two operation modes which are distinguished by the wait4eot bit. For each channel the DMFC can store a maximum number of EOL indication. The maximum number of EOL indications of EOL is given in the table below.

Table 37-27. DMFC's number of EOL indications

| IDMAC's Channel | Maximum lines on the FIFO |
|-----------------|---------------------------|
| 23 | Up to 3 lines |
| 27 | Up to 2 lines |
| 28 | Up to 2 lines |
| Other | Up to 1 line |

If the use case is that the number of EOL indications cannot exceed the maximum number of EOL indications than the user should have the wait4eot cleared.

If the use case is that the number of EOL indication can exceed the maximum number of EOL indications than the user should have the wait4eot set.

Having the wait4eot bit set has performance impact as the DMFC analyzes the data prior to sending it to the destination. In addition the DMFC cannot utilize the entire FIFO allocated to this channel.

The user need to specify the burst size of the IDMAC by setting the DMFC_BURST_SIZE field. This field must match the IDMAC settings. In case that the IDMAC's burst size is not a power-of-2 number, the value of this field should be rounded up to the nearest power-of-2 number. The burst size must not be greater than the FIFO's size.

37.4.8.1.2 Arbitration between channels

The arbitration between channels is fully hardware controlled. IDMAC has the highest priority. Then the synchronous channels. Then the asynchronous channels.

37.4.8.1.3 Watermark

The DMFC can generate a water mark signal for each channel. The watermark signal is sent to the IDMAC and dynamically increases the channels priority on the IDMAC's arbitration.

The watermark feature is enabled by the DMFC_WM_EN bit. The FIFO is partitioned to bursts. The user can set the watermark level at a burst boundary.

The watermark signal is set when the number of bursts on the FIFO + the number of already requested burst is smaller than the value specified on DMFC_WM_SET bit.

The watermark signal is cleared when the number of bursts on the FIFO + the number of already requested burst is greater than the value specified on DMFC_WM_CLR bit.

DMFC_WM_SET must be smaller than DMFC_WM_CLR.

37.4.8.2 IC interface

One of the IDMAC channels can be replaced by a flow coming from the IC using the DMFC_IC_IN_PORT. The user has to provide the IC's setting to the DMFC by programming the DMFC_IC_FRAME_WIDTH_RD, DMFC_IC_FRAME_HEIGHT_RD and DMFC_IC_FRAME_PPW_C fields. The burst size of the channel coming from the IC should always be programmed to 4 words.

37.4.8.3 DC write channel and AHB accesses

The second physical memory of the DMFC serves the

- IDMAC write channel (read from display)
- 2 AHB channels that can be read or write

The IDMAC write channel is programmed using the DMFC_RD_CHAN register in a similar way to the DC and DP read channels described above. The user has to provide the frame width and height for this channel and the pixel per word parameter.

The AHB channels are used from accesses via the AHB port to the display. The accesses are distributed between channels according to the MCU_T parameter.

37.4.9 DP - Display Processor

The display processor processes the image prior to sending it to the display. The main task performed by the DP is combining between 2 planes.

The DP has 2 input FIFOs holding the data of full plane and the partial plane. In addition the DP performs some image enhancement functions like gamma correction, Color space conversion including Gamut mapping.

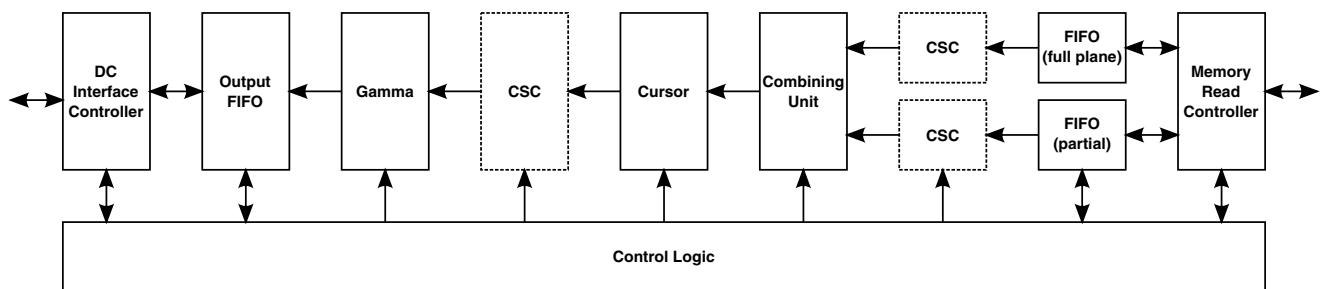

Figure 37-36. DP Micro architecture diagram

37.4.9.1 The DP programming model

The DP supports 3 flows. One sync flow and 2 Async flows. The DP holds 3 sets of registers. one set for each flow. Hence when referring to a register in this section the information is applicable to all the 3 sets. for example when referring to DP_COM_CONF, the information is applicable to DP_COM_CONF_SYNC, DP_COM_CONF_ASYNC0 and DP_COM_CONF_ASYNC1.

37.4.9.2 Displayed Planes

The following figure shows the planes displayed on a display.

There are full and partial planes. The partial plane's position is defined relatively to the upper left corner of the full plane (FGXP and FGYP parameters on the corresponding IPU_DP_FG_POS register). The size of the partial and full planes is defined on the corresponding IDMAC's channels' FW and FH parameters. The cursor position and parameters are set in the DP_CUR_POS register.

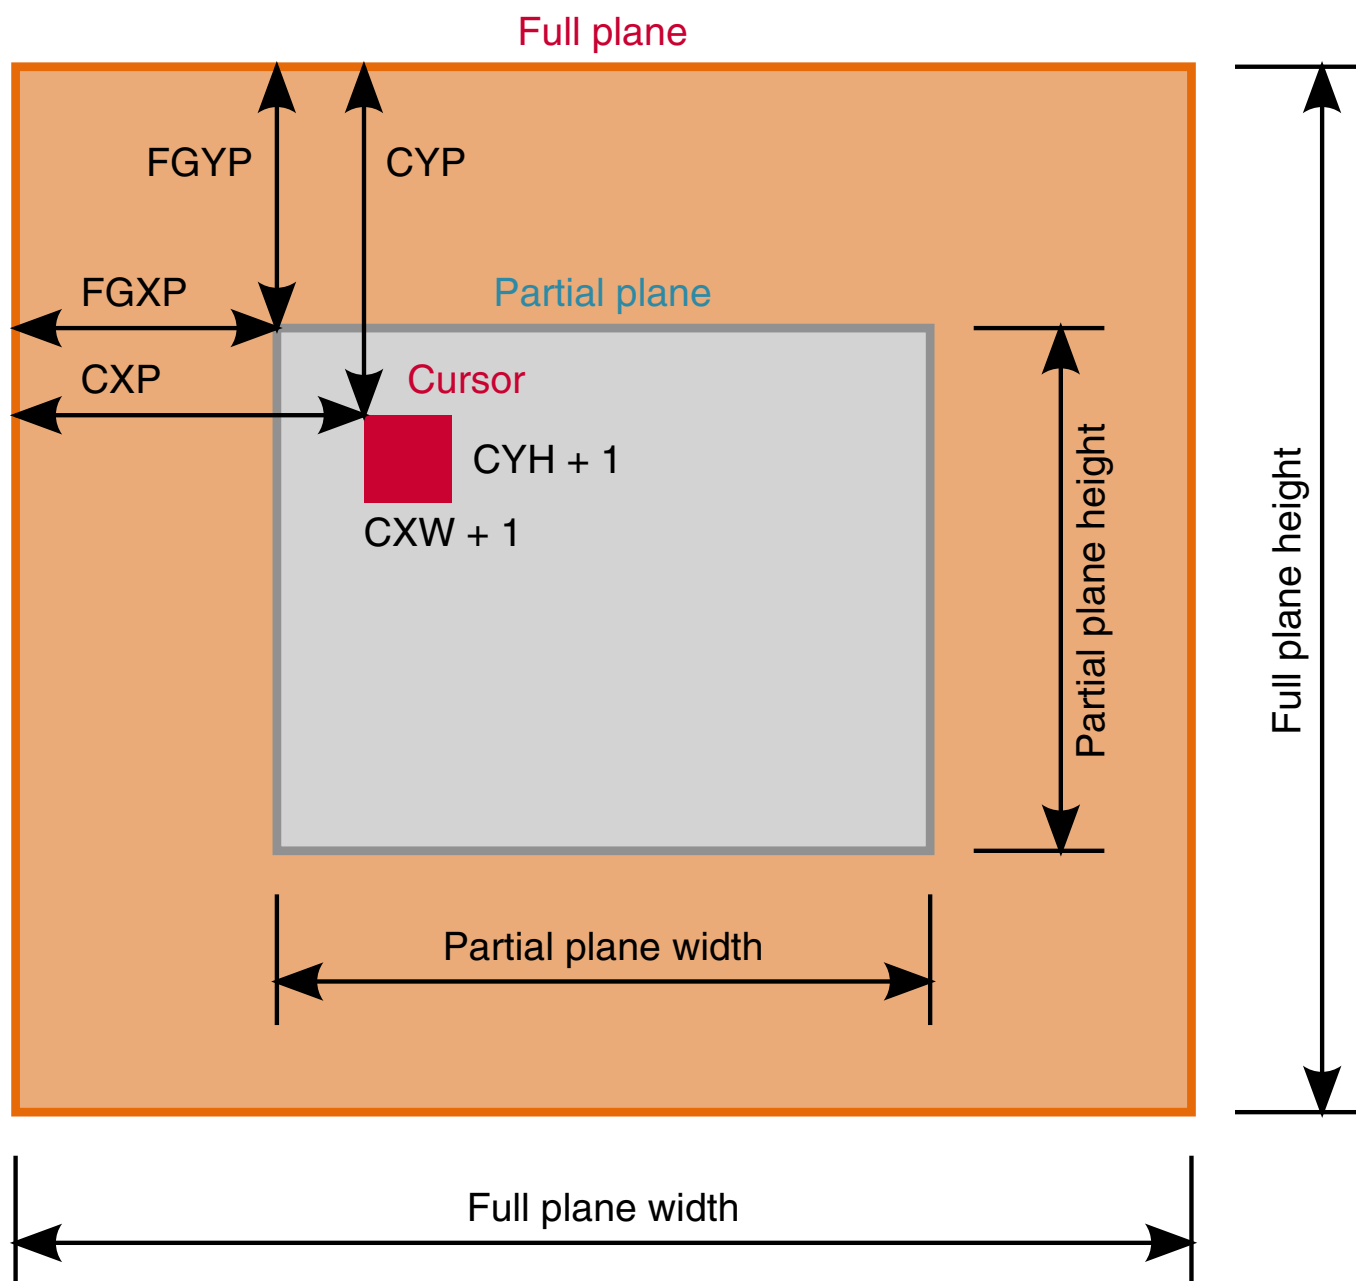

Figure 37-37. Displayed Planes

37.4.9.3 Combining Unit

The Combining Unit performs combining between the full and the partial planes. Each one of the planes may be graphics or video plane.

There are the following combining options:

- local alpha blending,
- global alpha blending,
- use of key color.
- order of the planes (full is presented over the partial plane and vice versa)

Combining mode is selected via the DP_COM_CONF Register. The combining equation is:

$$OP = BG * (1 - a) + FG * a$$

Where BG and FG are 2 input pixels; The DP_GWSEL bit defines if the BG is the pixel coming from the full plane or the partial plane.

$a = (A + \text{floor}(A/128))/256$ - an alpha value

A - a global or local transparency parameter.

The global A is written in the DP_GWAV field, the local A arrives together with the pixel.

A pixel becomes transparent when color keying is enabled and a pixel color matches a key color (independently on an alpha parameter). The color keying is defined on: DP_GWCKR, DP_GWCKG, DP_GWCKB

Combining takes 1 cycle per pixel. The Combining Unit outputs 24-bit words in the RGB/YUV format.

37.4.9.4 Cursor Generator

The Combining Unit output is passes through the Cursor Generator. The cursor's size and position are set via the DP_CUR_POS Register, a cursor color - via the DP_CUR_MAP Register. Different logic functions of combining the cursor with the image are supported as defined by the DP_COC field.

The cursor can be blinking. The blinking mechanism resides on the display controller sub-block. The blinking parameters are defined on the DC_BK_EN and DC_BKDVIV fields.

37.4.9.5 Color Space Conversion unit - CSC

The DP can get 2 input pixels from 2 different color spaces (YUV or RGB) and convert one of them to a common color space (YUV or RGB). In addition the 2 inputs can be of the same color space where the result is converted to another color space (YUV or RGB).

The DP has a single CSC unit that can be placed on one of 3 locations:

- At the output of one of the 2 input FIFOs
- At the output of the cursor generator.

Placing is done according to the DP_CSC_DEF field.

The color conversion implements a 3x3 matrix multiplication between the full RGB pixels and the color conversion constants, in order to obtain a YCC format image.

The conversion formula is:

$$x \rightarrow \text{Clip}(\text{Round}(S * 2^E)), S = Ax + B$$

where

A is a 3x3-dimensional matrix of weights, each a 10-bit signed number with 8 fractional digits

$$A = \begin{bmatrix} \text{CSC_A0} & \text{CSC_A1} & \text{CSC_A2} \\ \text{CSC_A3} & \text{CSC_A4} & \text{CSC_A5} \\ \text{CSC_A6} & \text{CSC_A7} & \text{CSC_A8} \end{bmatrix}$$

B is a 3-dimensional vector of offsets, each a 14-bit signed number with 2 fractional digits

$$B = [\text{CSC_B0} \quad \text{CSC_B1} \quad \text{CSC_B2}]$$

S is a 3 dimensional vector of sums, each a 16-bit signed number with 4 fractional digits

$$S = Ax + B$$

E is an exponent, assuming one of the following values: -1,0,1,2 (allowing weights up to 8). The CSC_S parameters are encoded by 2 bits, please refer to the CSC_S parameter description.

$$E = \begin{bmatrix} CSC_S0 & CSC_S1 & CSC_S2 \end{bmatrix}$$

A more explicit formula:

$$S[i] = (\text{sum}(A[i][j]*In[j]) \gg 4) + (B[i] \ll 2) + (1 \ll (3-E[i]))$$

$$Out[i] = \text{Clip}(S[i] \gg 4-E[i])$$

Where Clip() performs clipping to the range 0..255 (either per-component clipping or more sophisticated clipping that preserves the hue of the pixel)

37.4.9.5.1 Gamut mapping

When the color transformation produces colors outside the allowed range, they must be mapped back. This is called gamut mapping. The DP supports 2 clipping algorithms. (controlled by GAMUT_SAT_EN bit)

Hue preserving clipping algorithm is suitable only for RGB components. For YUV components, the per-component clipping algorithm is used.

Per component Clipping

This mapping is performed by clipping each of the components independently to its allowed range of values (the final value being uint8):

- Y: to 0..255 or 16..235 according to the SAT_MODE bit
- U/V: to 0.255 or 16..240 according to the SAT_MODE bit

Hue Preserving Clipping

Hue Preserving clipping is done in the following way

- First stage - eliminating negative values

```
N = min(R,G,B)
if (N<0) X-> X-N, where X=R,G,B
```

- At this stage, all components are non-negative and the MSB's beyond d=11 bits are ignored (assumed 0).

- Second stage - eliminating large values

```
M = max(R,G,B) (d-bit integer)
if (M>255)
```

Functional Description

```
M' = M >> (m-7), where m=8..d-1 is the index of the most-significant non-zero
bit in M
D' = Ceil(256*255/M') = 256..510 (since M' = 128..255)
Ceil(x) = the smallest integer which is not smaller than x
Implemented by a hard-wired 128x9-bit LUT
X -> min(255, (X*D')>>(m+1)), where X=R,G,B (8x9 multiplier)
else
X -> X
```

37.4.9.6 Gamma correction

The DP includes a gamma correction function. It is approximated by the piece-wise polynomial:

$$\text{gammar} = \text{GAMMA_C}_{<i>+ ((R[4:0] * \text{GAMMA_S}_{<i>}) >> 4 + 1) >> 1}$$

Where R is the input red component, that's a 9 bit input composed $\text{pixel_in} * 2 + \text{pixel_in}[7]$.

Single approximation slope is used for Gamma Correction of red, green and blue color components. However the Gamma Correction block instantiated three times since processing for color components should be done in parallel. The gamma transform is also available for changing the contrast of the luminance component only.

The required Gamma correction slope for a specific display should be provided by the display manufacture. This information can be provided in various forms, as graph or formula. The gamma correction input pixel level (Gin) should be normalized to a maximum of 383. The gamma correction output pixel level (Gout) should be normalized to a maximum of 255. Then a following data should be collected:

Table 37-28. Gamma correction values

| Gin | Gout |
|-----|--------|
| 0 | Gout0 |
| 2 | Gout1 |
| 4 | Gout2 |
| 8 | Gout3 |
| 16 | Gout4 |
| 32 | Gout5 |
| 64 | Gout6 |
| 96 | Gout7 |
| 128 | Gout8 |
| 160 | Gout9 |
| 192 | Gout10 |
| 224 | Gout11 |
| 256 | Gout12 |

Table continues on the next page...

Table 37-28. Gamma correction values (continued)

| Gin | Gout |
|-----|--------|
| 288 | Gout13 |
| 320 | Gout14 |
| 352 | Gout15 |

Based on the table above the values of DP_GAMMA_S_SYNC<i> and DP_GAMMA_C_SYNC<i> fields for gamma correction control registers are calculated as following:

Table 37-29. Gamma correction values

| i | DP_GAMMA_C_SYNC<i> | DP_GAMMA_S_SYNC<i> |
|----|--------------------|--------------------|
| 0 | Gout0 | 16*(Gout1-Gout0) |
| 1 | 2*Gout1-Gout2 | 16*(Gout2-Gout1) |
| 2 | 2*Gout2-Gout3 | 8*(Gout3-Gout2) |

| 15 | Gout15 | 255-Gout15 |

37.4.9.7 DC interface

The DC interface unit performs 2 tasks.

- Starts the flow via the DP by getting a request from the DC and once the DP is ready send the new frame request to the IDMAC.
- Control the DP's output FIFO and send the data to the DC using an handshake mechanism.

37.4.9.8 DP's flows management

The DP can manage up to 3 flows: one synchronous flow and 2 asynchronous flows. However the DP can handle only one flow simultaneously. The DP has an automatic mechanism to control and switch between flows.

The DP's highest priority flow is the sync flow. An async flow can be executed during the blanking interval of the sync flow. An async flow can be stopped in order to serve the sync flow. The sync flow cannot be broken. The DP holds 3 sets of registers, one set for each flow. The registers are located in the SRM memory. According to the flow that needs to be executed the correct set of registers is loaded to the DP.

The figure below illustrates the flow management done by the DP.

A flow starts when a request from the DC arrives and the internal pipe is empty. For sync flows, the full frame NF (new frame) indication arrives immediately. In case that a partial frame is also used the NF indication will be sent one row before the row that the partial plane is actually positioned.

In case of ASYNC flow the DP first check if the previous async flow was broken. If yes, the DP restores the last settings of the previous flow. If this is a new async flow the DP will first reload the flow's parameters from the SRM. In case that a partial frame is also used the NF indication will be sent one row before the row that the partial plane is actually positioned.

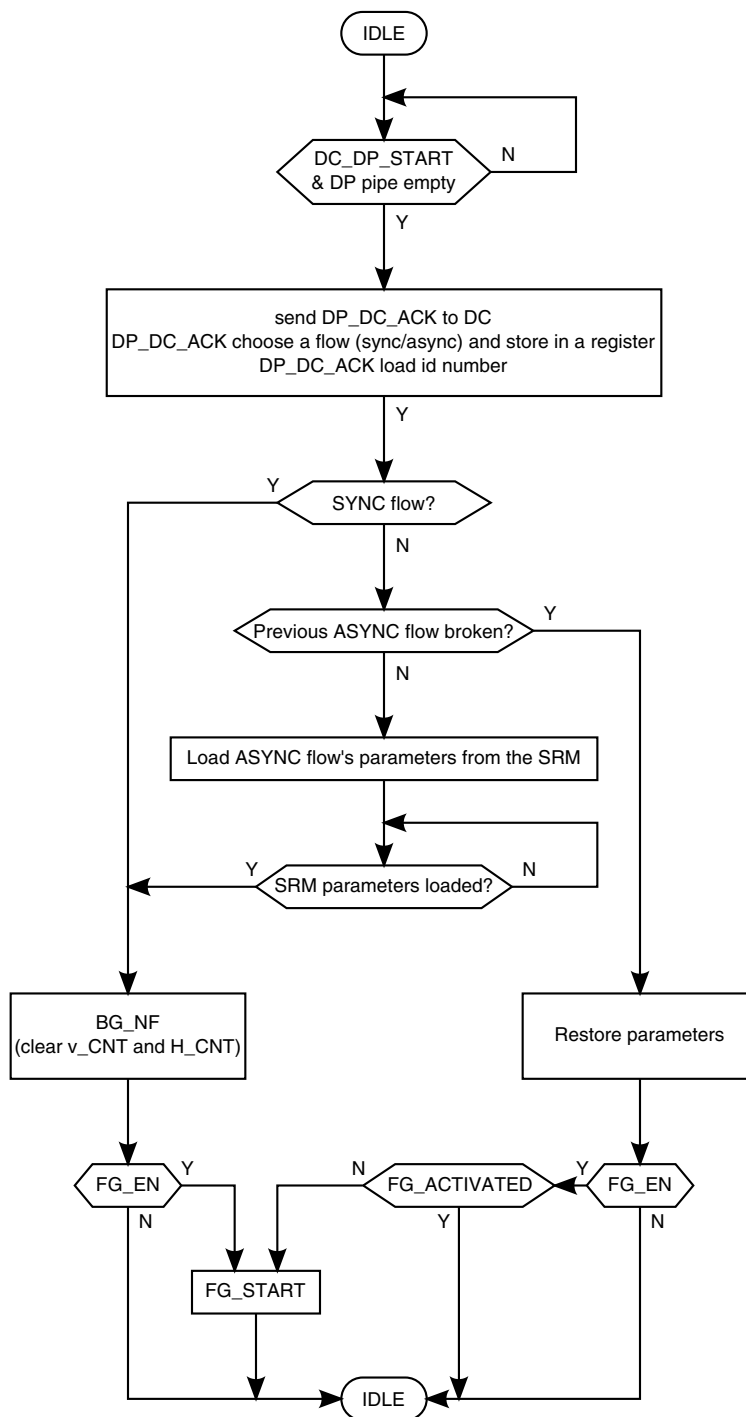

Figure 37-38. DP flow management chart

37.4.9.9 DP debug unit

The DP supports synchronous and asynchronous flows using the same hardware. The asynchronous flow can be broken by the synchronous flow. The DP's debug unit provides the ability to know on which row exactly the async flow has been broken. This is done by providing an interrupt (with DP_DEBUG_CNT register) and providing row status flags (on DP_DEBUG_STAT register).

As the async flow can be broken multiple times within a specific frame the user can control the breaking point by issuing the debug event by programming BRAKE_CNT field.

37.4.9.10 Restriction

When both full and partial planes are processed, the full plane's minimal frame width is 13 pixels.

The Minimum frame height supported by the DP is 2 lines.

37.4.10 Display Interface (DI)

The DI provides arbitrated access to up to three displays with time multiplexing. It converts data from the DC or the ARM platform (low level access for serial interface only) to a format suitable for the specific display interface.

The DI generates display clocks and other display control signals with programmable timings. The DI outputs data to or inputs from parallel and/or serial interfaces.

This block generates all the control signals sent to the display. The DC sends to the DI; the data for the display and a set of control signals. The controls coming from the DC are used in order to generate the control signals sent to the display. One exception is serial low level access (LLA), where the DC is bypassed and the data is coming directly from the ARM platform. The figure below is the DI's block diagram.

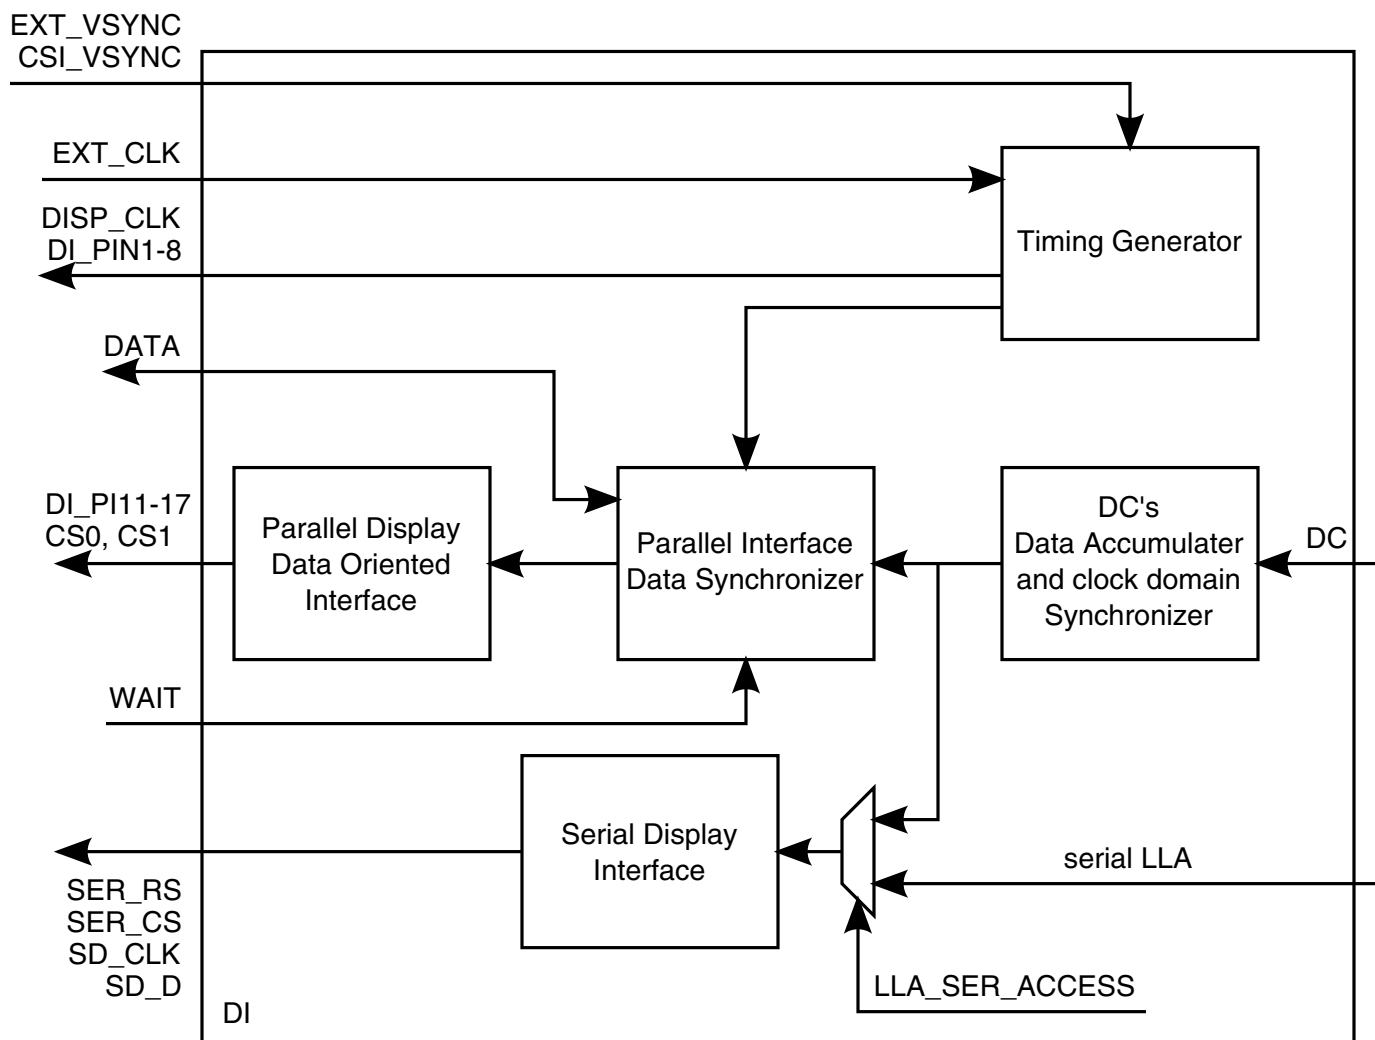

Figure 37-39. DI's block diagram

The display interface includes 2 groups of control signals:

- Time oriented signals - These type of signals are generated according to the DI's internal timers. These are free running signals that change their state according to a pre-defined waveform. For example VSYNC, HSYNC, display's clock (pixel clock) etc.
- Data oriented signals - The DC may add markers to data sent to the DI. These markers are used to indicate a specific attribute of the data (for example: end-of-line, end-of-frame, chip-select etc.). The marker coming from the DC triggers a specific waveform of one or more signals on the display's interface. The specific waveform will be seen on the bus along with the associated data. The markers may be synced to a time oriented signal. For example: attach the end-of-frame signal to the next VSYNC.

37.4.10.1 DC interface, data accumulator and clock domain synchronizer

The data accumulator is the DI's input buffer. It receives the data from the DC along with a set of control signals. The data accumulator receives the data from the DC's clock domain and synchronizes it to the DI's clock domain.

37.4.10.2 Parallel interface data synchronizer and data oriented interface

The data accumulated in the DI's input buffer will be sent to the display according to the DI's internal events. Each event is generated by a counter. A tag is attached to each data by the DC's microcode using the SYNC field in the DC's microcode. The tag selects the event that the data will be synced to.

Once the corresponding event is generated, the data will be sent to the display. A data can be a pixel or a component (part of a pixel). The data synchronization occurs separately for each component. For asynchronous displays the tag will be equal to 0 i.e. the data is not synchronized to any event. The data will be sent out of the buffer immediately.

37.4.10.3 Timing generator

The timing generator is used for generating the waveforms' of each pin of the display's interface.

The timing generator is built of 10 counters. One counter functions as a time base. This timer is called the BASE TIMER (BS). The other 9 counters are used in order to generate the control signals' waveforms. The last counter (counter #9) is special see [Counter number 9](#).

The DI clock can be derived from IPU's clock (HSP_CLK) or from an external source (via the DIIn_DISP_CLK - ipp_di_#_ext_clk pin). The clock's source is statically selected by configuring the DI#_CLK_EXT bit.

[Figure 37-41](#) illustrates the main parameters of a waveform. A waveform's segment is built of 5 parameters. Each segment can have 2 phases "ACTIVE PHASE" and "OFFSET PHASE".

- **TIMEBASE** - this is the base timer (fundamental timebase); all the other parameters are derived from this timer. The timebase is generated by counting DI clock cycles. The amount of cycles is defined according to DI#_DISP_CLK_PERIOD. This field

defines the Display interface clock period, This parameter contains an integer part (bits 11:4) and a fractional part (bits 3:0). It defines a fractional division ratio of the DI's source clock for generation of the display's interface clock. The timebase is generated from edge aligned pulses of the DI clock. The user can delay the timebase starting point by defining an offset to the timebase. This is done by configuring the DI#_DISP_CLK_OFFSET field. The offset is calculated from the point where the DI is enabled to the point where the timebase starts ticking. The display clock waveform is generated between 2 edges of the timebase. The waveform is defined according to the DI#_DISP_CLK_UP and DI#_DISP_CLK_DOWN. Each pin has a specific timebase that is derived from the fundamental timebase. The following figure illustrates the relations between the TIMEBASE and the DI's clock

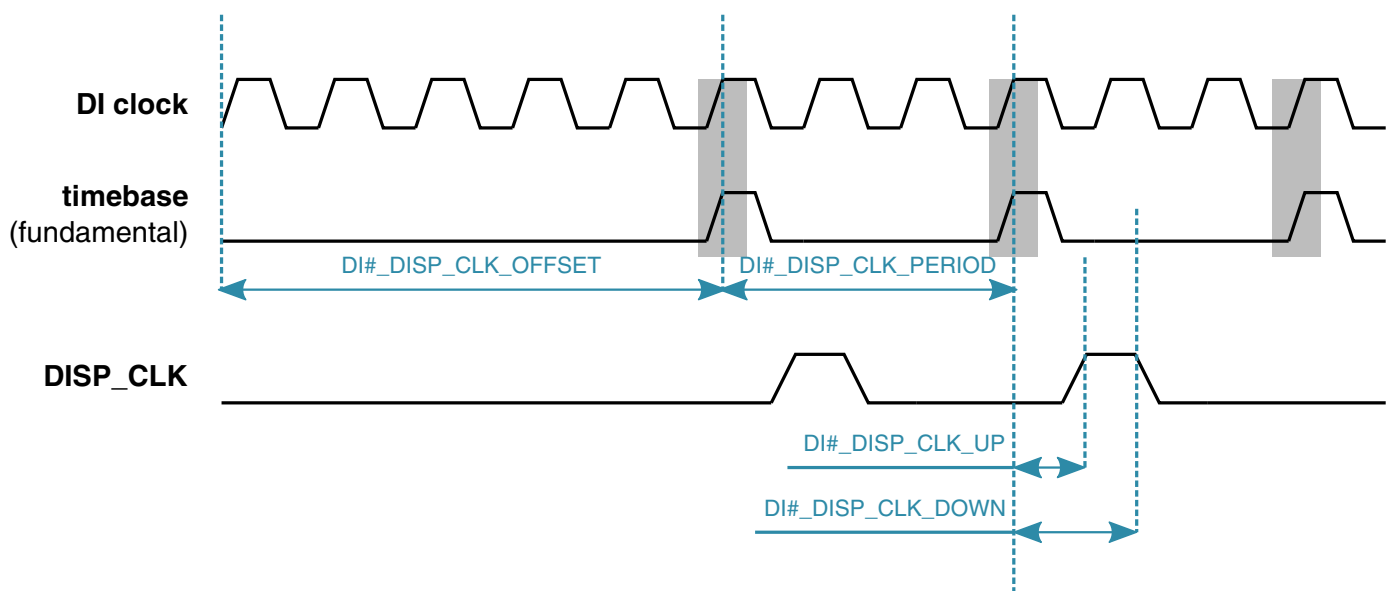

Figure 37-40. Timebase, DI's clock and display's clock relations

- **OFFSET** - this parameter defines when the length of the "OFFSET PHASE" it is defined by di#_offset_value_<N> field, where N is the counter's index.
- **STEP** - This parameter defines the length of the "ACTIVE PHASE"; it is defined by the di#_step_repeat_<N> field, where N is the counter's index. If the counter is in auto reload mode (di#_cnt_auto_reload_<N> bit is set) then the counter will be automatically reloaded forever. The value of di#_step_repeat_<N> is ignored in that case.
- **RUN** - The "ACTIVE PHASE" is partitioned to several "RUN sections"; this parameter defines the length of the "RUN section"; it is defined by the di#_run_value_m1_<N> field, where N is the counter's index.

Functional Description

- **UP** - Each "RUN section" contains the waveform of a single pulse. This parameter defines the offset from the beginning of the "RUN section" to the assertion of the signal; it is defined by the `di#_cnt_up_<N>` field, where N is the counter's index.
- **DOWN** - This parameter defines the offset from the beginning of the "RUN section" to the negation of the signal; it is defined by the `di#_cnt_down_<N>` field, where N is the counter's index. In case where `DOWN < UP` the waveform will have a 50% duty cycle.

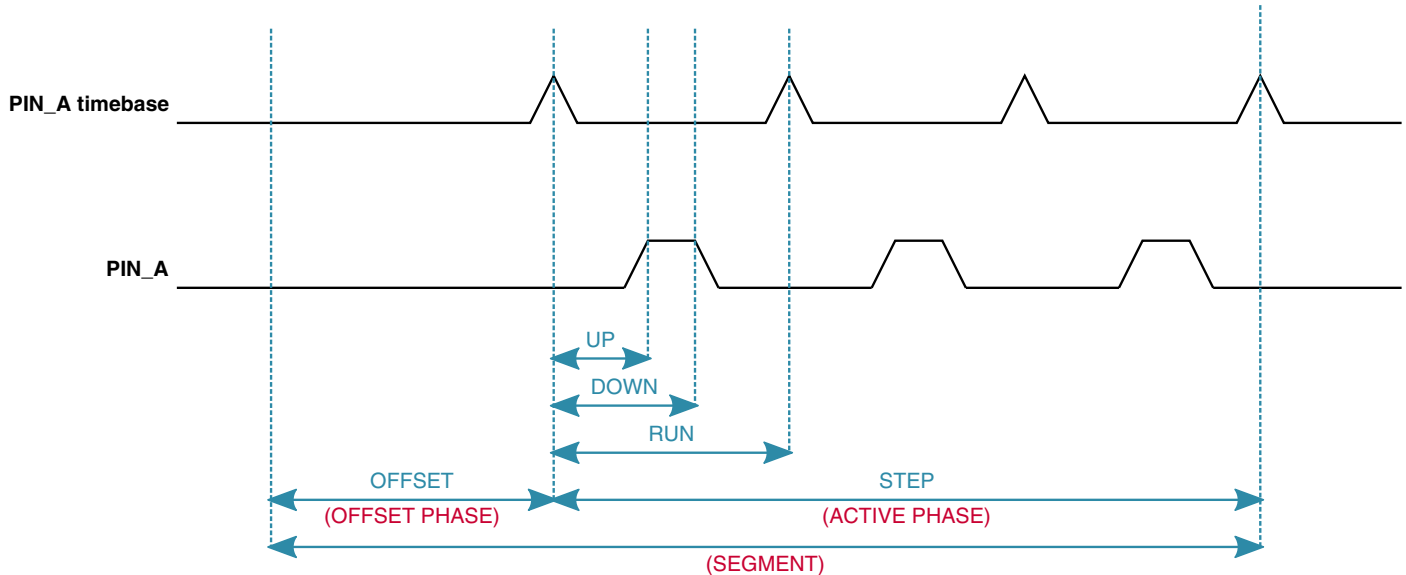

Figure 37-41. DI waveform's main parameters

37.4.10.3.1 Waveform concatenation

The DI provides the ability to derive the waveform from the fundamental timebase or from another PIN. In that case, one pin's waveform is used as another pin's timebase.

The following figure provides an example. PIN_A and PIN_C are derived from the fundamental timebase. However, PIN_B is derived from PIN_A's waveform. The trigger is selected by `DI#_RUN_RESOLUTION_<N>`, where <N> is the index of the counter. A counter can be triggered by a counter with lowered index. For example: counter #5 can be triggered by counter #3 but can't be triggered by counter #7.

Figure 37-42. DI pins - Waveform's time bases concatenation

37.4.10.3.2 The basic counter

The DI has 9 counters. A counter is built of 3 units: timebase generator, waveform generator and polarity generator.

Figure 37-43 illustrates the counter's structure.

The timebase generator

The timebase generator gets 3 triggers. Clear, offset and run trigger. The Clear is the trigger that resets the counter. It is selected by programming the `DI#_CNT_CLR_SEL_<N>`.

The Offset trigger is the trigger used for counting the `OFFSET_PHASE`. The user can select the source of the trigger by programming the `DI#_OFFSET_RESOLUTION_<N>`. The offset's value is defined by programming the `DI#_OFFSET_VALUE_<N>`.

The RUN trigger is the trigger used for counting the RUN period. The user can select the source of the trigger by programming the `DI#_RUN_RESOLUTION_<N>`. The RUN's value is defined by programming the `DI#_RUN_VALUE_<N>`.

The timebase generator counts according to the `DI_CLK` or according to another counter's output. In order to use a source different than `DI_CLK`, the user should set the `POLARITY_GEN_EN` bits to 01.

Waveform generator

This unit generates the waveform. It gets the values of RUN, UP, DOWN and STEP and build the waveform accordingly. The waveform is counted according to the signal generated by the timebase generator.

Polarity generator

The waveform's polarity is controlled by 2 units. The static polarity is changed according to the POLARITY_<#> bit of each pin. This bit defines if the waveform of the pin is active high or active low.

The other unit controlling the polarity is the polarity generator. This unit is enabled by setting the POLARITY_GEN_EN[1] to 1. The polarity generator has 2 modes: "toggle mode" and "normal polarity mode". The mode is defined according to POLARITY_GEN_EN[0].

- Normal polarity mode - In this mode the polarity is changed according to 2 other counters. The counter selected by POLARITY_TRIGGER_SEL define the sampling point. The counter selected by POLARITY_CLR_SEL defines the polarity value. At the sampling point the polarity value is defined. The current polarity value defines the current polarity of the waveform.
- Toggle mode - In this mode, the output of the timebase generator's output causes the polarity to toggle. Any tick of the timebase generator inverts the polarity. When this mode is enabled the ticks generated by the counter selected by POLARITY_TRIGGER_SEL initialize the polarity generator and the timebase generator causes the polarity to toggle.

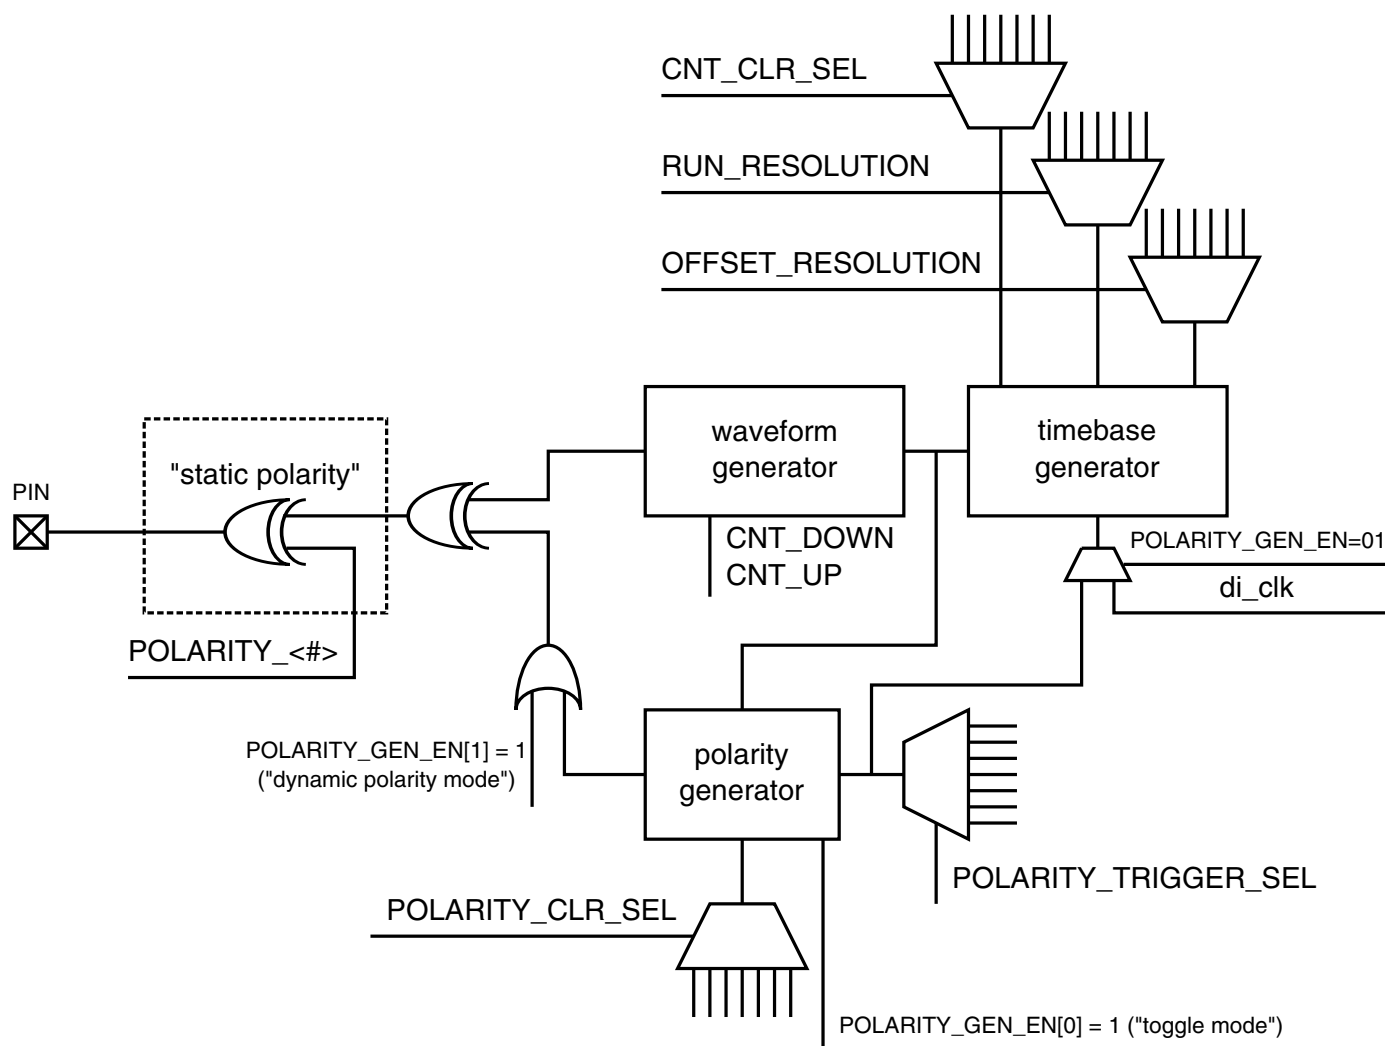

Figure 37-43. DI's counter's structure

The following figure provides an example for waveform generation using different trigger sources. The waveform is generated for PIN_D. PIN_D counter is cleared by the PIN_C's timebase. The offset period is calculated by counting cycles of PIN_B's timebase. The RUN period is calculated by counting cycles of PIN_A's timebase. The UP and DOWN periods of the waveform are calculated by counting cycles of PIN_D's timebase.

Figure 37-44. Clear, offset and run triggers and values - Example

37.4.10.3.3 Counter number 9

The last counter (counter #9) is an auxiliary counter and it is not used for generating a waveform for a specific pin. It can be used in order to attach another waveform to an existing one.

The user defines the waveform for a specific pin (main pin). The user defines the auxiliary waveform using counter #9. The 2 waveforms are logically ORed. The combined waveform will be routed to the main pin. The main waveform that this counter is attached to is defined according to DI#_GENTIME_SEL_9.

The tag of counter #9 can be generated from counter #9 or from the main waveform. This is selected according to the DI#_TAG_SEL_9.

37.4.10.3.4 DI's active window

The DI provides an alternative way to define the synchronous display setting by using an active window and thus, needs to program less counters. The synchronous display's active window is a rectangle on the display where IPU sends data. It is set by programming the parameters defined on DI#_AW0 and DI#_AW1 registers.

The following figure illustrates the different parameters defining the active window. The display's vertical and horizontal position are defined according to counters. The DI#_AW_HCOUNT_SEL selects the counter which the horizontal position is calculated according to. DI#_AW_VCOUNT_SEL selects the counter which the vertical position is calculated according to. The Active data is sent according to a trigger. DI#_AW_TRIG_SEL selects the counter which calculates this trigger. This trigger usually functions as a data enable signal.

Figure 37-45. DI's Active Window

37.4.10.4 Waveform settings for asynchronous interface pins

The DI provides 8 signals that are used for asynchronous interface. These signals are PIN11 through PIN17 (ipp_di_#_pin_11 through ipp_di_0_pin_17) and the CS (ipp_di_0_do_dispb_d0_cs).

The DI holds 12 wave set quartets. Each quartet includes 4 registers (DI#_DW_SET<j>_<i>). Each DW_SET register holds the UP and DOWN values of the waveform. The DW_SET register is selected in the following way. The WAVEFORM field in the DC template is a pointer that points to one of the 12 quartets. In addition the WAVEFORM field points to one of 12 DI#_DW_GEN_<i> registers. The DI#_DW_GEN_<i> holds 9 pointers. The pointers are 2 bits field that points to one of the registers from the DI#_DW_SET<j>_<i> quartet. Each one of the 8 pointers in the

DI#_DW_GEN_<i> registers is related to a specific pin of the DI's asynchronous interface. The following figure illustrates the relations between the registers controlling the asynchronous interface's signals.

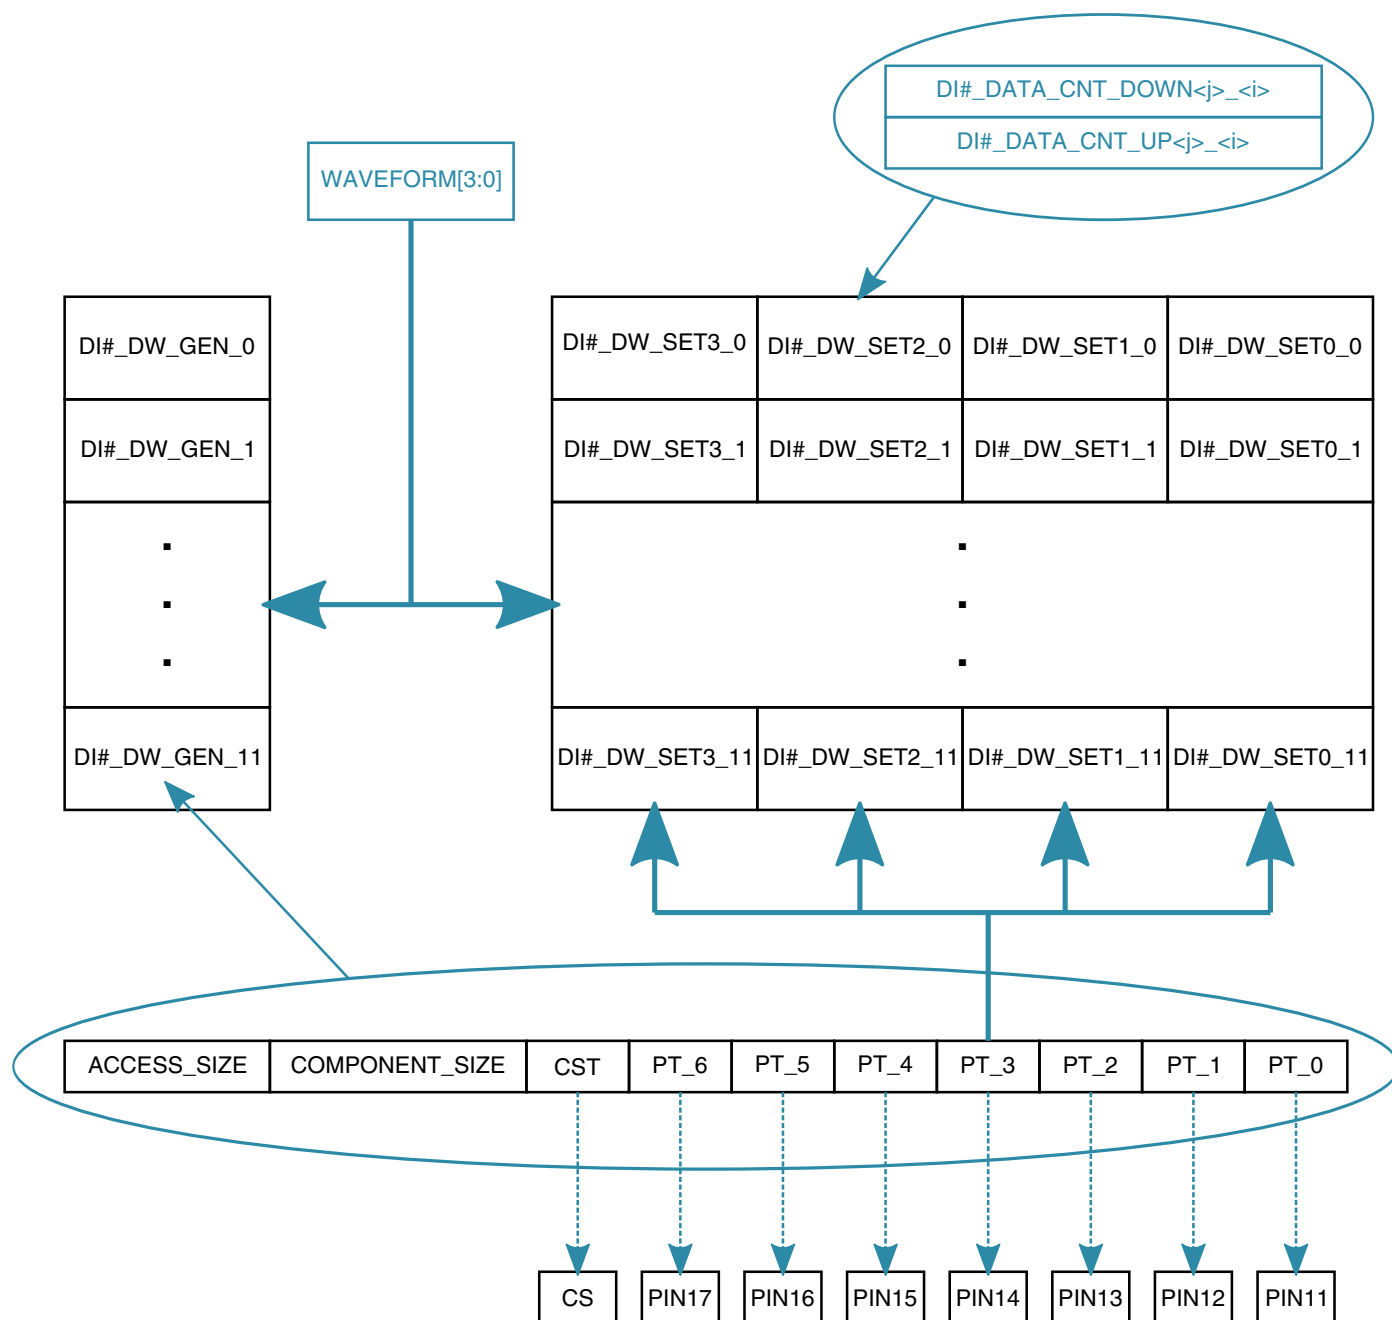

Figure 37-46. Waveform settings for asynchronous interface pins - parallel interface

The DI#_DW_GEN_<i> register includes the data's waveform settings as well. ACCESS_SIZE defines the amount of DI clock cycles that a pixel is valid on the bus. When generic data is sent, this field defines the amount of cycles that the generic data is

valid on the bus. A pixel may be broken into few components. The COMPONENT_SIZE field defines the amount of cycles that each component is valid on the bus.

The COMPONENT_SIZE is always smaller or equal to ACCESS_SIZE. For synchronous interface COMPONENT_SIZE is always equal to ACCESS_SIZE. In case that there's a need for some gap between one type of accesses to another having the COMPONENT_SIZE smaller than ACCESS_SIZE can be useful (for example read after write accesses that require some gap between them).

37.4.10.5 Serial display interface

The DI supports the following asynchronous serial interfaces:

1. 3-wire (with bidirectional data line).
2. 4-wire (with separate data input and output lines).
3. 5-wire type 1 (with sampling RS by the serial clock).
4. 5-wire type 2 (with sampling RS by the chip select signal).
 - For serial interfaces accessed in LLA mode, data and preamble lengths and other parameters are controlled via the DI0_SER_CONF and DI1_SER_CONF Registers.

The serial display interface includes generators for the CS, RS and CLK signals of the display interface and a bidirectional datashifter. The figure below provides a block diagram of the serial display interface.

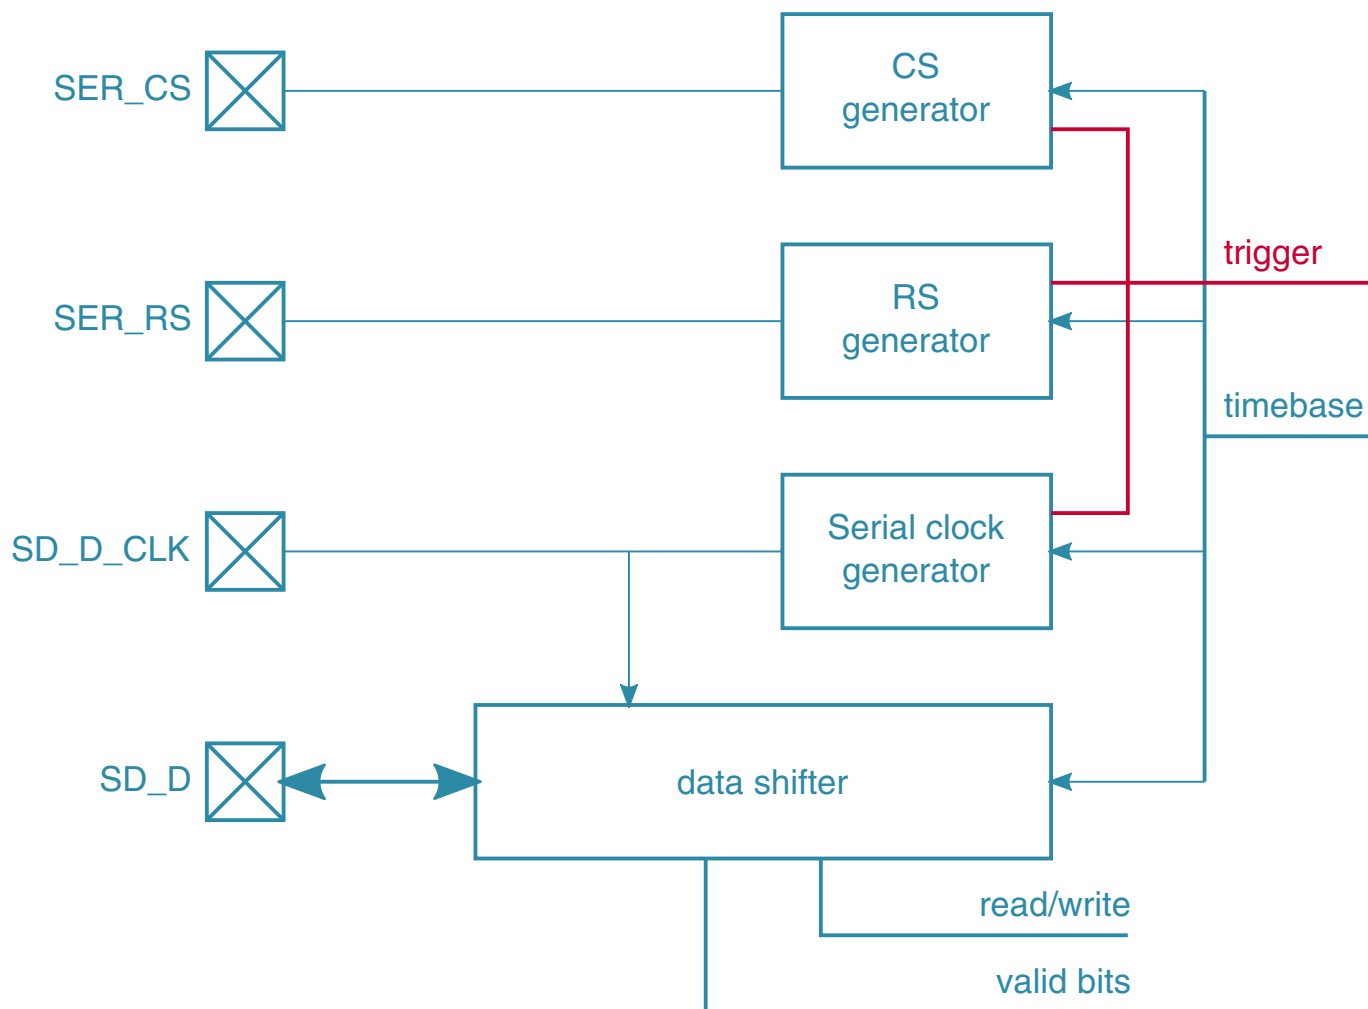

Figure 37-47. Serial display interface

37.4.10.5.1 Waveform settings for serial interface pins

When serial interface is used the fields in the `DI#_DW_GEN_<i>` register have different meaning than the parallel interface. The registers includes pointers to `DW_SET` for the CS, RS and CLK pins of the serial interface.

The following figure illustrates the relations between the registers controlling the serial interface's signals.

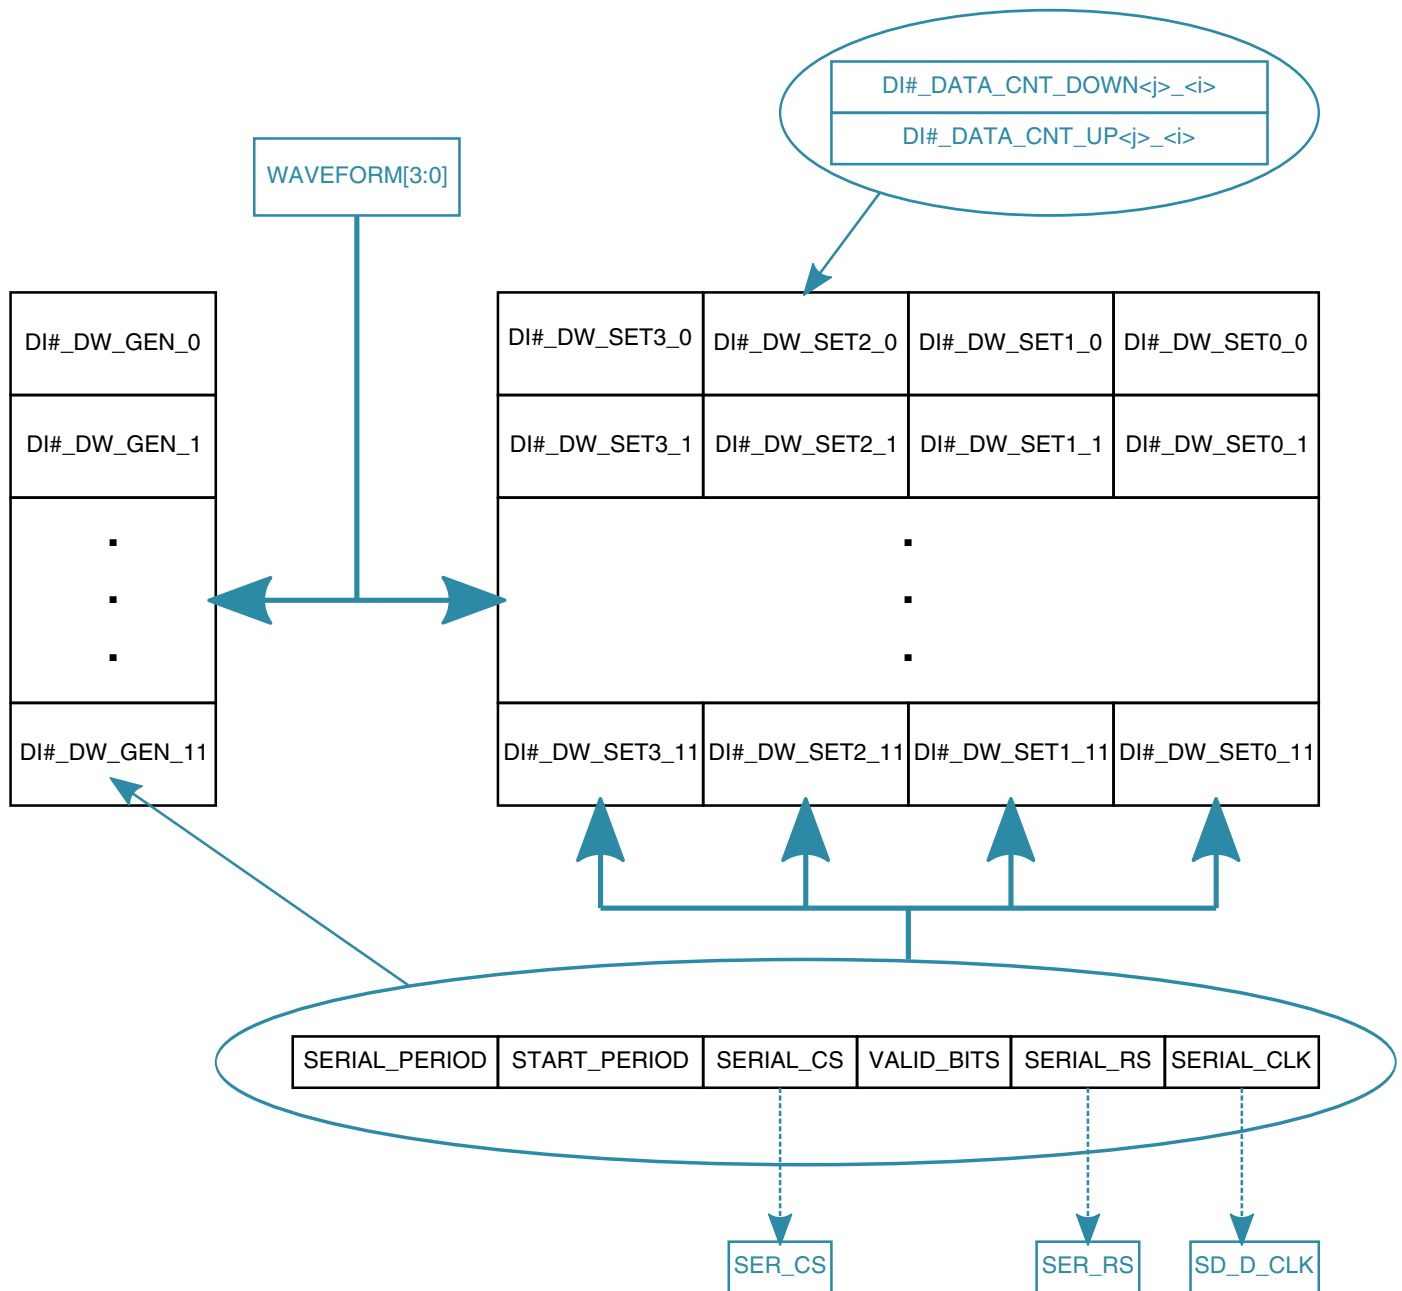

Figure 37-48. Waveform settings for asynchronous interface pins - serial interface

The following figure provides an example of the waveform's settings for the serial interface. A waveform generation starts following a trigger indicating that the serial interface has won the DI's arbitration. Therefore the next access will be via the serial interface. The waveform is based on timebase ticks. All the waveform's settings are defined by counting DI_CLK cycles. The timebase starts ticking after counting DI_CLK cycles defined on the START_PERIOD parameters. The number of timebase ticks is defined according to the VALID_BITS field. The VALID_BITS field defines how many bits will from the 32 bit word sent to the DI are valid and should be sent via the serial

interface. The valid bits are the least significant bits of the word coming from the DC. The amount of DI_CLK cycles between each timebase tick is defined according to the SERIAL_PERIOD parameter. Each one of the serial interfaces control signals may have a different waveform defined according to its corresponding UP and DOWN values.

Figure 37-49. Serial interface waveform example

The CS and RS signals can have a single change (one rising and one falling edges) between 2 consecutive triggers. The UP value for RS and CS is measured from the first timebase tick. The DOWN value is measured from the last timebase tick. The figure below provides an example of the RS behavior, CS behaves in a similar way.

The data is sent according to the timebase ticks. The MSB bit of the data is transmitted first. When receiving serial data, the data is sampled every timebase tick. The user can program an offset from the timebase tick by programming the DI#_SERIAL_LATCH field. This value will move the serial data sampling point. The value is measured by counting DI_CLK cycles.

Figure 37-50. Serial interface waveform example of RS

37.4.10.6 Low Level Access - LLA

LLA is a ARM platform direct access to the display. For parallel displays the DI's behavior for LLA is the same as any other access to a parallel display. For serial displays the DI allows a DI arbitration bypass. This is done if the DI#_LLA_SER_ACCESS bit is set.

In that case there is a direct access from the DMFC to the DI which bypasses the DC allowing simultaneous access to both serial and parallel interfaces. When DI#_LLA_SER_ACCESS bit is set, the user must not do any other kind of accesses to the serial interface except LLA. When DI#_LLA_SER_ACCESS bit is set the corresponding DI#_WAIT4SERIAL must be clear.

37.4.10.7 Using a mask channel

The IPU is able to provide the windowing function on displays that have data enable control. This is achieved by masking of some screen regions according to a 1-bit/pixel mask read from the memory via IDMAC through channel #44.

When the mask value is zero, the pixel is not displayed. This feature can be used for dual-port smart displays.

37.4.11 Video De Interlacing or Combining Block (VDIC)

The Video De-Interlacer as well as the Combiner have two operation modes:

Functional Description

- De-interlacing: converts an interlaced video stream to progressive order.
- Combining: combines two video/graphics planes and a background color.

The Video De-interlace block (VDIC) deinterlaces standard interlaced video to produce progressive video, that is used for upsizing to HD formats or for display on progressive displays. For VDIC operation three fields are necessary $F(n-1)$, $F(n)$, $F(n+1)$. The $F(n-1)$ field arrived through CSI interface in real time mode or through channel 1 and then stored in FIFO1. The $F(n)$ arrived through channel 2. At least three lines of $F(n)$ are stored in Line Store memory. The $F(n+1)$ arrived through channel 3 and stored in FIFO3. FIFO controllers read data from FIFOs and then data aligned in pixels buffers. From the buffers the data arrived to Line Padding Controller (LPC). The LPC padding missing line at the beginning and end of the frame. The DeInterlacing sub-block (DI) perform the processing. Then data send to IC sub-block for processing or for transferring to external memory.

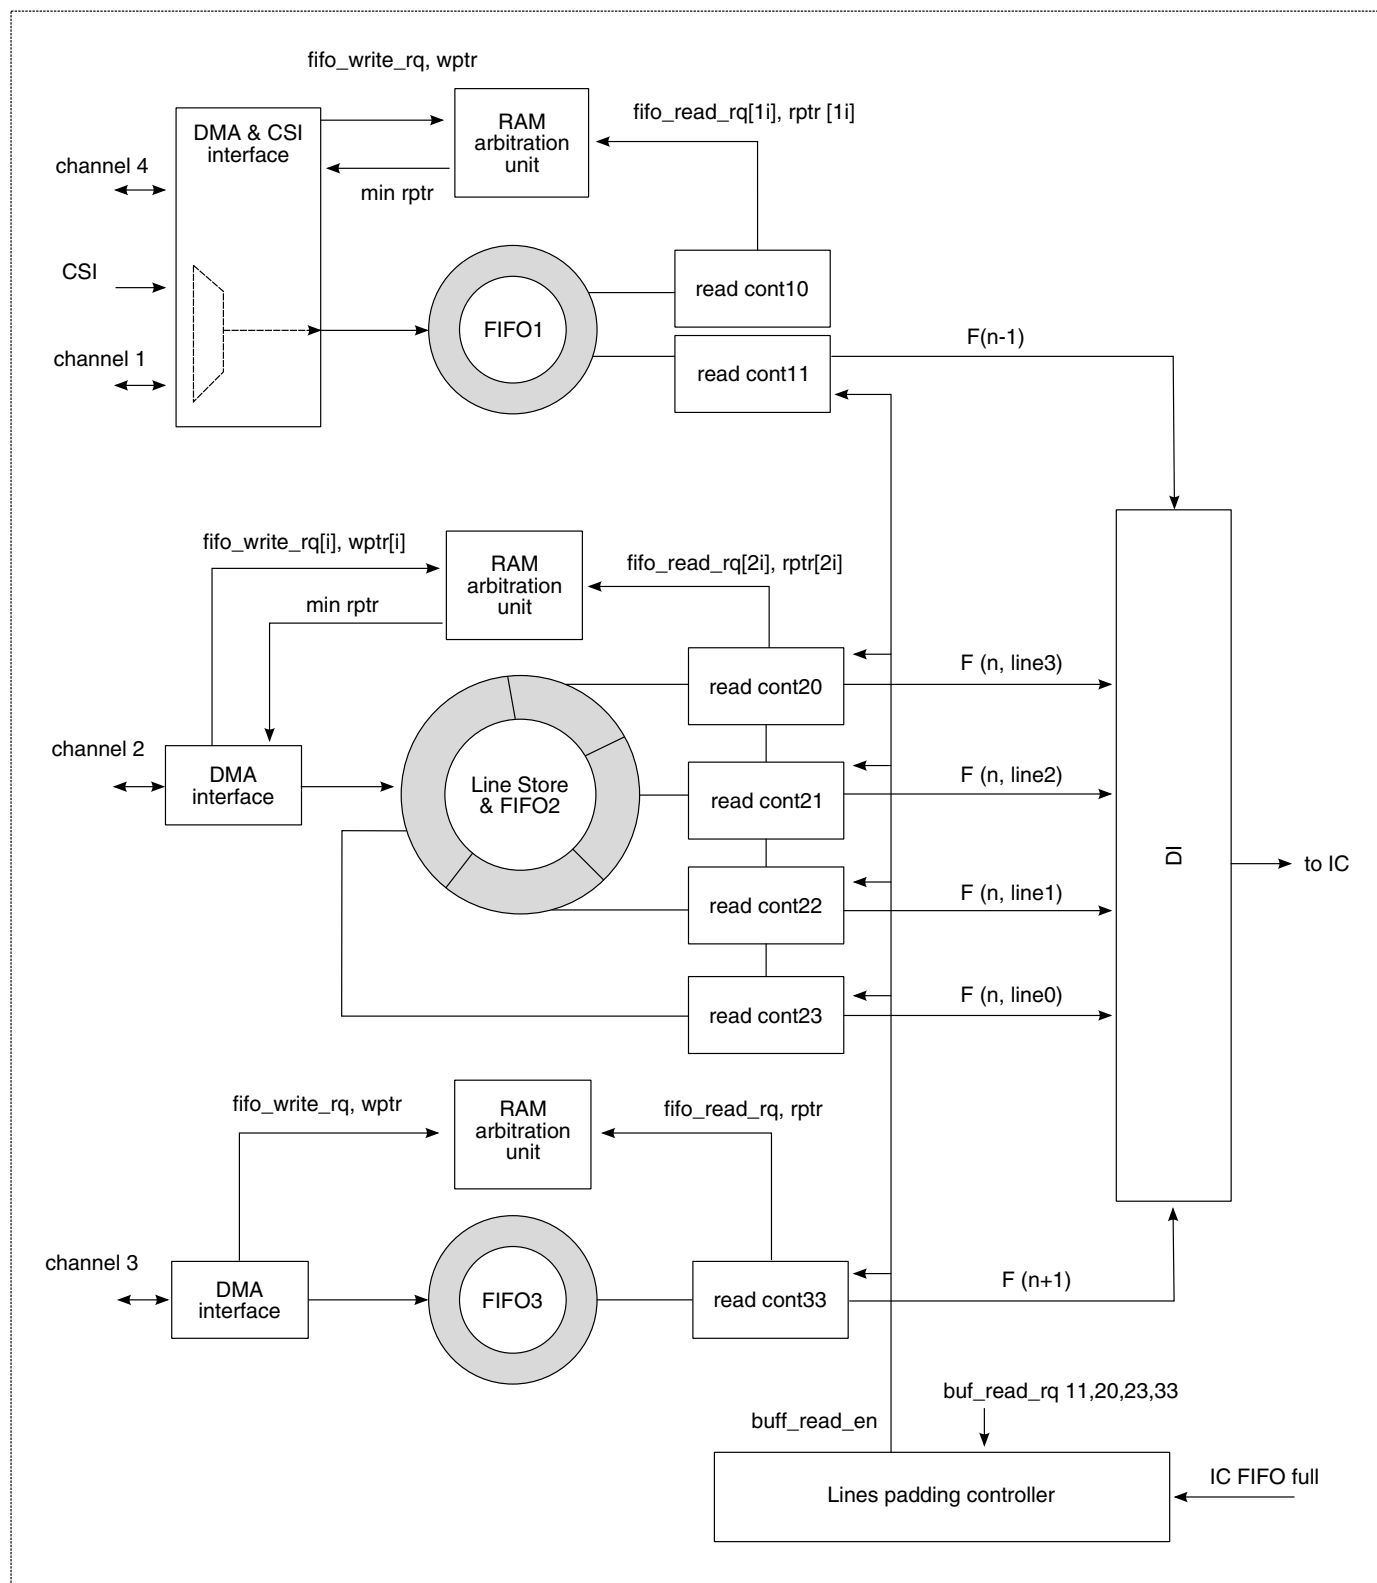

Figure 37-51. VDIC Block Diagram

37.4.11.1 VDIC Features

Key features of the VDIC block include:

- Deinterlacing
 - maximum horizontal resolution 968 pixels
 - maximum pixel rate 75100MP/s
 - Support YUV422 and YUV420 formats
- CSI FIFO mode
- Combining

37.4.11.2 De interlacer (DI) sub-block

The block diagram of the DI block is shown in figure below.

Pipelining is inserted at all stages, so that the design may run at a fast clock speed, if needed.

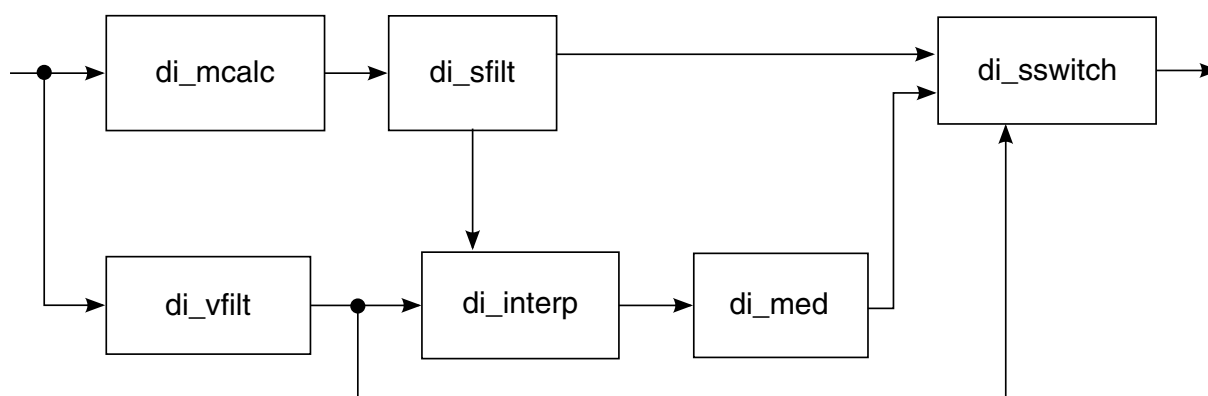

Figure 37-52. DI block diagram

37.4.11.2.1 Vertical Filter Block (di_vfilt)

The `di_vfilt` block performs spatial vertical filtering of pixels.

It is a four tap vertical filter:

$$\text{vfilt_out} = (-3.0 * \text{pix1} + 19.0 * \text{pix2} + 19.0 * \text{pix3} - 3.0 * \text{pix4}) / 32.0$$

Where pix1, pix2, pix3, pix4 are four pixels in same horizontal location on four consecutive lines of a field.

vfilt_out is pixel being predicted (between pix2 and pix3)

37.4.11.2.2 Motion Calculator Block (di_mcalc)

The mcalc block estimates the amount of motion for any given pixel by looking at pixel values in current, previous and next fields.

The generic formula used to calculate the estimated motion is:

$$m = \text{SAT}(Ks * ((le-w) / ((le-w) + |n-s| + \text{SPA_DETAIL})))$$

- Where, n is the pixel above the pixel being predicted
- s is the pixel below the pixel being predicted
- e is the pixel in previous field at same spatial location as the pixel being predicted
- w is the pixel in next field at same spatial location as the pixel being predicted
- m is motion estimation for the pixel being predicted (range from 0 to 1)
- Ks is slope control and decides how quickly the algorithm switches from no motion (m=0) to full motion (m=1)
- SPA_DETAIL is a constant (50) that is added to ln-sl.
- SAT() is saturate at 1 function

The motion calculator block is simplified in a certain respect, by removing the need for a divider, while providing a degree of flexibility. The main motivators for this are the following observations:

1. the above equation defines a set of curves based on the value of ln-sl, but the curves are fairly closely spaced, so that using a granularity of 8 in ln-sl to define specific curves to use gives pretty much the same quality of picture as using all of the curves; and once ln-sl reaches about 120, the effect of an increased ln-sl value is hard to observe
2. once le-wl gets to about 15, the motion is usually saturated to a value of 1

Based on the above observations, the motion calculator is now implemented with the use of two "ROM"s, using the 4 LSBs of le-wl and bits 6:3 of ln-sl.

The motion calculator has 3 modes of operation. These modes are defined by the VDI_MOT_SEL field. In case that the user has an information about the motion (For example SW analyzing motion vectors provided by a video decoder) he can select one of the modes listed below. Changing the value of the VDI_MOT_SEL has an affect only on the next frame.

- When VDI_MOT_SEL==2'b01, m_calc is 0 (no motion - use weave)

- When $\text{VDI_MOT_SEL} == 2'b10$, We assume high motion and use $\min(15, \text{delta_t})$.
- When $\text{VDI_MOT_SEL} == 2'b00$, We assume low motion and use $\text{sat}([0,15], \text{delta_t}-8)$ ($\text{delta_t}-8$ is signed operation).

37.4.11.2.3 Spatial Motion Filter (di_sfilt)

The di_sfilt block spreads motion signal over five pixels:

$$\text{Mspread} = \text{MAX}(m3, (0.5*m1 + m2 + m3 + m4 + 0.5*m5)/4.0)$$

- Where, m3 is motion estimate for current pixel
- m2 is motion estimate for previous pixel
- m4 is motion estimate for next pixel
- m1 is motion estimate for pixel before previous pixel
- m5 is motion estimate for pixel after next pixel

37.4.11.2.4 Interpolated Pixel Calculator Block (di_interp)

The di_interp block uses the motion estimated by the di_sfilt block and computes an interpolated pixel that is weighted sum of the surrounding four pixels (n, s, e, w).

The block performs the following calculations:

```

        if (Mspread <= 0.5) {
i = (1-2*Mspread)*(e+w)/2 + 2*Mspread*vfilt_out
        } else {
            i = vfilt_out
        }

```

Where, i is the interpolated pixel

n, s, e, w are surrounding pixels as explained earlier

37.4.11.2.5 Median Filter Block (di_med)

The di_med block performs a 5-point median of n, s, e, w and i pixels.

It should be noted that the median required here is not a true 5-point, but can be implemented more efficiently as a 3-point median:

$$\text{med} = \text{MEDIAN}(\min(\max(n,s), \max(e,w)), \max(\min(n,s), \min(e,w)), i)$$

37.4.11.2.6 Soft Switch Block (di_sswitch)

The final output of the deinterlacer is a blend of the median value and the vertical filter, assuming that the pixel data n,s are uncorrelated with the pixel data e,w. By uncorrelated, we mean $(\max(n,s) < \min(e,w))$ or $(\min(n,s) > \max(e,w))$.

```

        if (Mspread <= 0.5 || not(F)) {
    pix_out = med
    } else { /* Mspread > 0.5 */
    pix_out = (1-2*(Mspread-0.5))*med + 2*(Mspread-0.5)*vfilt_out
    }

```

37.4.11.3 DMA only Mode

In DMA only mode the data is coming from IDMAC only.

37.4.11.4 Real Time Mode

In Real Time Mode the $F(n-1)$ are coming from CSI. The CSI write to FIFO1. The DI sub-block read $F(n-1)$ from processing. In addition IDMAC read the field from FIFO1 and store in external memory. Then stored frames are used as $F(n)$ and $F(n+1)$.

37.4.11.5 CSI only Mode

In CSI only mode VDIC do not perform any processing and used as FIFO only. The data arrived from CSI written to FIFO1. The IDMAC read data from the FIFO1. The FIFO3 and Line store memory are not used. The ID sub-blocks are turned OFF. The CSI only mode can be used as alternative to SMFC, when appropriate.

37.4.11.6 Using Combining in the VDIC

As an alternate function to the de interlacing function, the VDIC can perform combining of two planes.

- Both planes have to be at the same color space.
- Overlaying of a single plane over a unified background is supported.
- The planes can be at a different sizes - one plane can be smaller than the other.
- Combining requires a single cycle per output pixel.
- Alpha blending (global or local) is supported.
- Color keying is supported.

The plane's location and size is programmable as shown in the following figure.

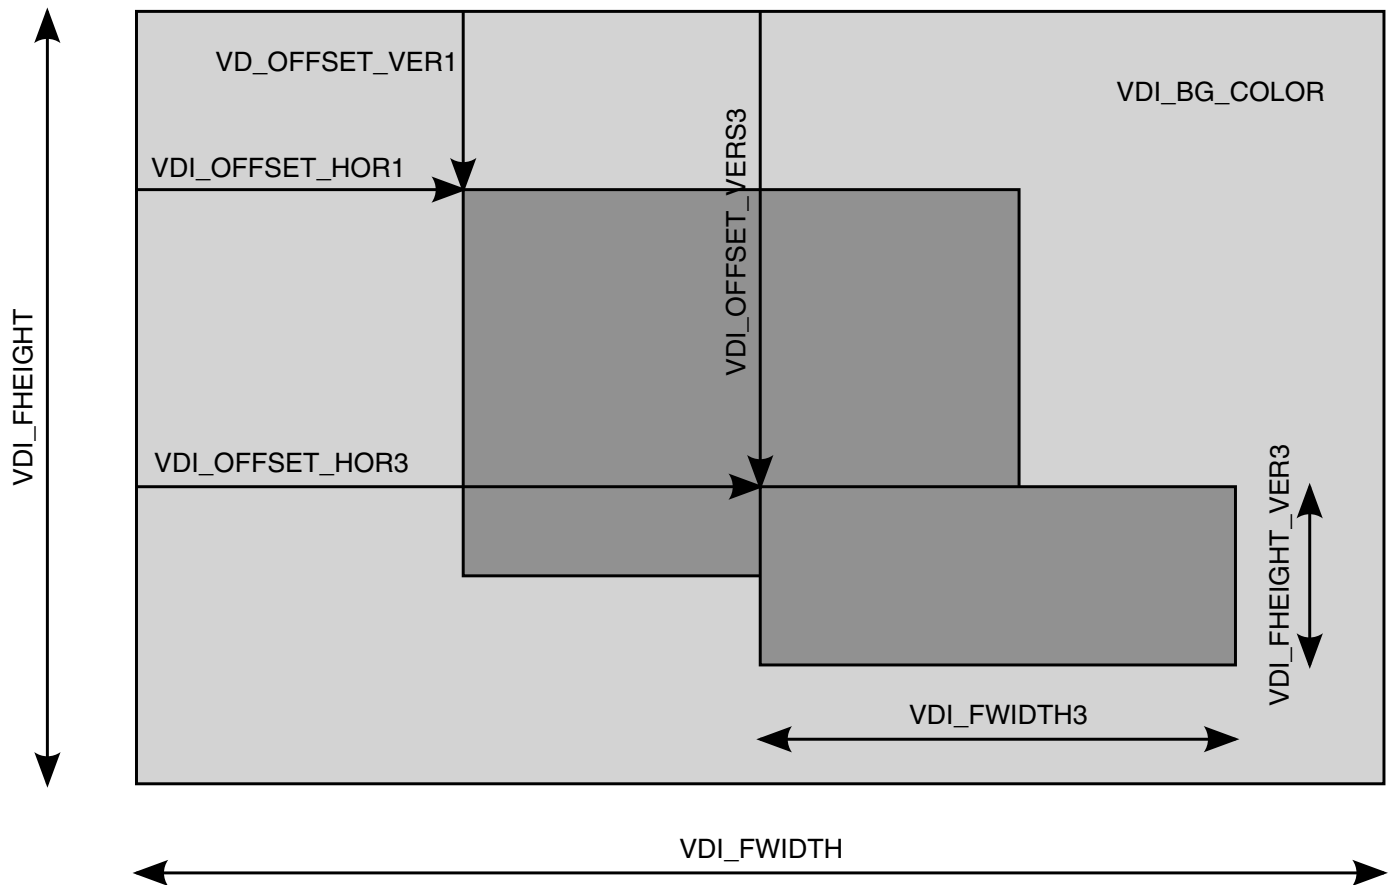

Figure 37-53. The relations between planes of the combining unit

When local alpha is used it should be arrived through channel3 of the VDIC.

The combining equation is:

$$OP = BG * (1 - \alpha) + FG * \alpha$$

Where "OP" is output pixel, "FG" is input pixel of foreground plan arrived thought channel3, BG is input pixel of background plan arrived thought channel1, "alpha" is global or local transparency.

37.4.11.7 VDIC Restrictions

- Maximum output pixel rate is 100 MP/s.
- The output pixel format (YUV422 or YUV420) are equal to input format.
- The VDIC can perform combining or de interlacing. It cannot perform both functions at the same time.

37.4.12 Control Module (CM)

37.4.12.1 Block Diagram

The CM Block Diagram is shown in the figure below.

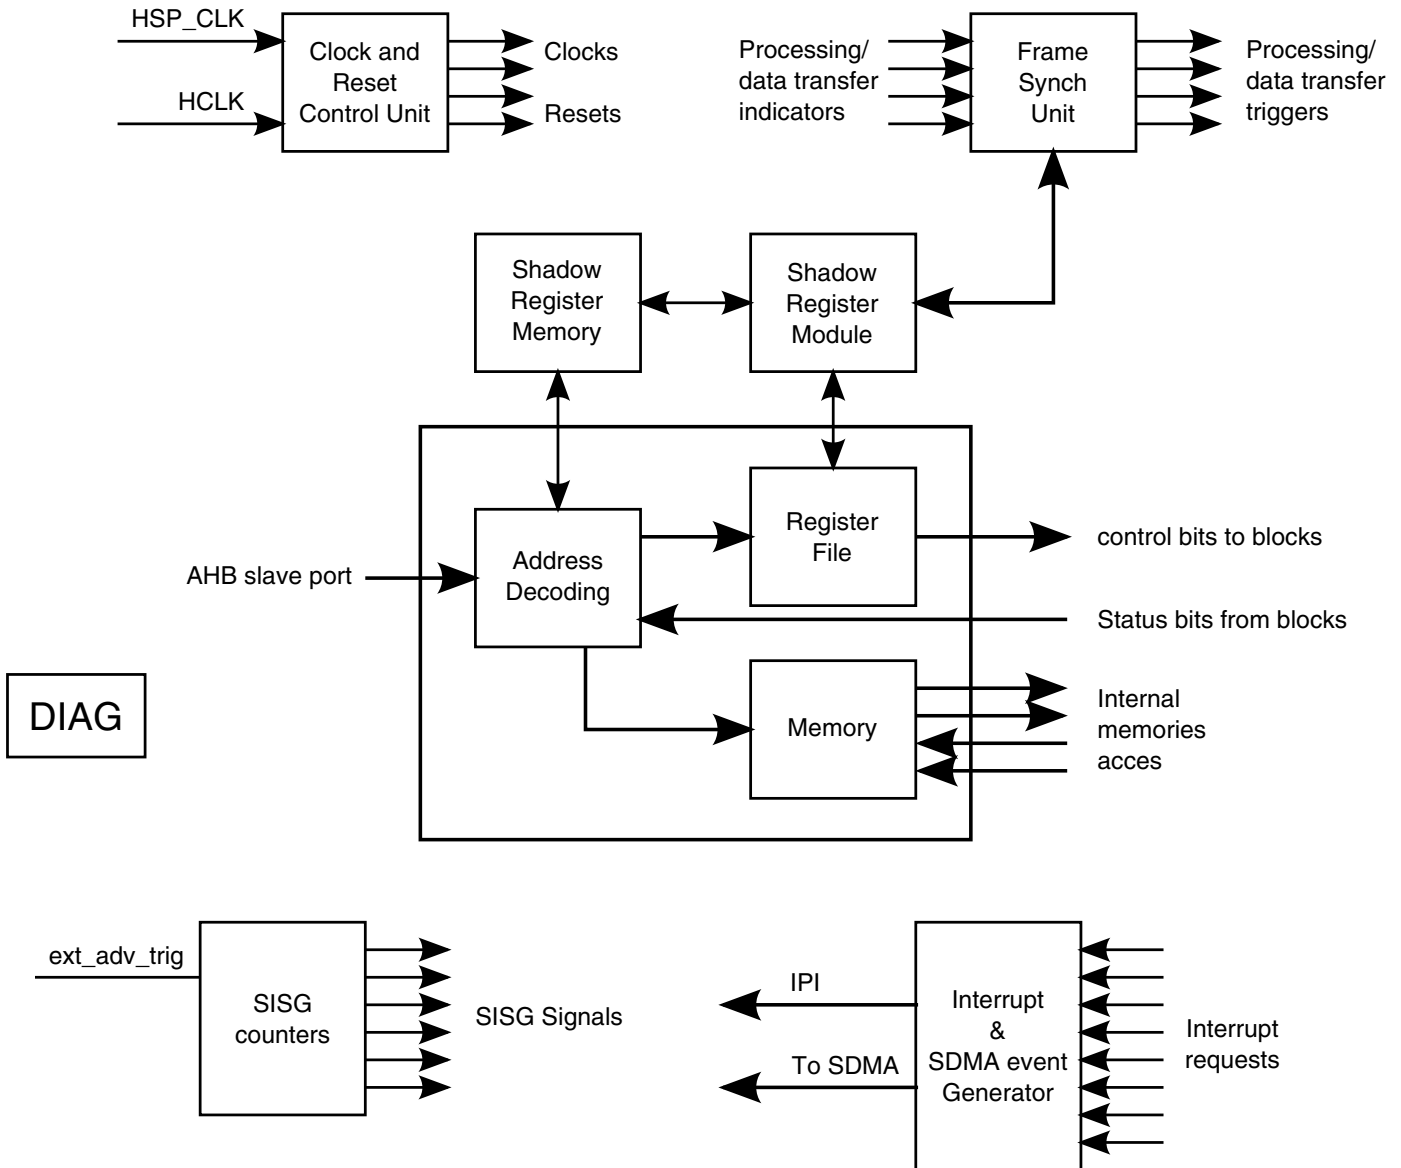

Figure 37-54. CM Block Diagram

The CM consists of the Frame Synchronization Unit (FSU), the Interrupt Generator (IG), the General Configuration Registers (GCR), the Clock and Reset Control Unit (CRCU) and the Shadow Registers Block (SRM).

37.4.12.2 Frame Synchronization Unit

This section details the frame synchronization unit.

37.4.12.2.1 General Description

The FSU provides synchronization of tasks performed by different IPU sub-blocks and ARM platform tasks. This allows to build complex processing flows which are performed automatically (without ARM platform involvement in synchronization of the IPU's tasks).

The FSU supports double buffering of image frames stored in the external memory and allows chaining IPU processing flows in automatic mode.

37.4.12.2.2 Frame Synchronization Flow

1. Initialization

The ARM platform initializes all the parameters for a task by writing to the GCR and to the parameters memories of each IPU sub-blocks. The initialization must occur before the ARM platform enables the task.

2. Enabling

After the initialization step has been completed, the ARM platform enables the task by setting its enable bit in an appropriate register.

3. Triggering

After the task is enabled, the FSU waits for triggering signal. The triggering signals is a combination of the enable bit and the buffer ready signal which can be driven by the ARM platform (DMA_CH_BUF<0/1>_RDY_<#>) and/or by the preceding task (IDMAC_EOF_# or Frame Complete signal from the DC).

The trigger causes the FSU to invoke the relevant unit to start by assertion of the NEW_FRM_RDY signal. In some cases triggering occurs at the enabling step (when the enable bit is the trigger for the task).

4. Operating

The triggering step cause the task to move to active mode, this is the operating step. In this step, the FSU monitors the synchronization signals from ARM platform, IDMAC and the corresponding processing units, and controls the units operation. The FSU also controls the IDMAC buffer toggling when double buffer page flipping is used.

The FSU checks at end of each frame if the next frame can be served. If the answer is yes, the FSU stays in active mode with re-sending the <TASK>_NEW_FRM_RDY signal and updating the relevant flags (e.g. DMA<BL>_<#>_CUR_BUF and DMA<BL>_<#>_BUF_RDY). If the answer is no, the FSU moves to pause mode and pauses the task waiting until the next frame can be served.

5. Disabling

When the task is disabled by the ARM platform (by negating the enable bit), it moves back to non-active mode.

37.4.12.2.3 FSU's fundamentals

Trigger source select

A flow is triggered by a trigger. The trigger may be asserted manually by the ARM platform or may be a result of the completion of the preceding task. Trigger's source select choose the source of the trigger. The trigger means that the data is ready to be processed by the sub-blocks. The trigger source select is defined by the corresponding SRC_SEL bits of the block or task.

Trigger destination select

A block or task that process data needs to know that the following task in the chain is ready to receive the processed data. The user needs to specify what is the destination of the processed data. This is done by setting the corresponding DEST_SEL bits of the block or task.

Double buffering

The IPU supports double buffering in the system's memory. When a flow is processed frame by frame the first frame will be read from one location (BUF0) in the memory, the next frame will be read from another location in the memory (BUF1). The location in the memory of the buffers is defined by the EBA0 and EBA1 parameters of the corresponding channel in the CPMEM. The IDMAC use the correct buffer according to the DMA_CH_CUR_BUF_# signal. The FSU automatically toggles the DMA_CH_CUR_BUF_# to point on the correct buffer to be used by the channel. In order to work in double buffer mode the corresponding DMA_CH_DB_MODE_SEL_# needs to be set.

Alternative flow

Some of the IPU sub-blocks can handle 2 flows via them one is the main flow and the other is the alt flow. In order to support an alternate flow via the same sub-block an alternative configuration should be used by the sub-block. This includes

- Alternate registers including an alternative sub-block's setup - this is handled by the SRM
- Alternate IDMAC settings: parameters in the CPMEM, separate alpha
- Alternate SRC_SEL as the source of the trigger may come from a different function.
- Alternate FSU settings (CUR_BUF, BUF_RDY, DB_MODE_SEL)
- Some of the display sub-blocks alternate settings are handled by programming an alternative set of registers.

The FSU handles the switch to the alternate flow, it controls the update of the alternate configuration and send the appropriate signals to other sub-blocks in the IPU indicating about a need to switch to the alternate configuration.

Once a frame is completed there is a chance that there are 2 buffers ready. One is the next buffer of the current flow and the other is the a buffer in an alternate flow. The FSU will automatically select between the next buffer to handle in a round-robin fashion.

IPU task chaining - Single flow

The diagram below illustrates task chaining in the In this example a single flow is handled

The Frames are coming from the same camera sub-block. The frames are handled frame by frame. The first frame arriving Frame0 is stored in BUF0 of the "INPUT BUFFER". Once the Frame0 is ready in BUF0, the processing sub-block is triggered and data is read from BUF0 to the processing sub-block. In the meantime, Frame1 coming from the camera is written to BUF1 of the "INPUT BUFFER". The processing sub-block processes the data and stores the first frame on BUF0 of the "OUTPUT BUFFER". Once the processing is done and the frame is ready, the display sub-block is triggered to pick the data and send it to the display. The processing sub-block will start working on the next frame once the data is ready in the "INPUT_BUFFER" and there's a free buffer in the "OUTPUT_BUFFER".

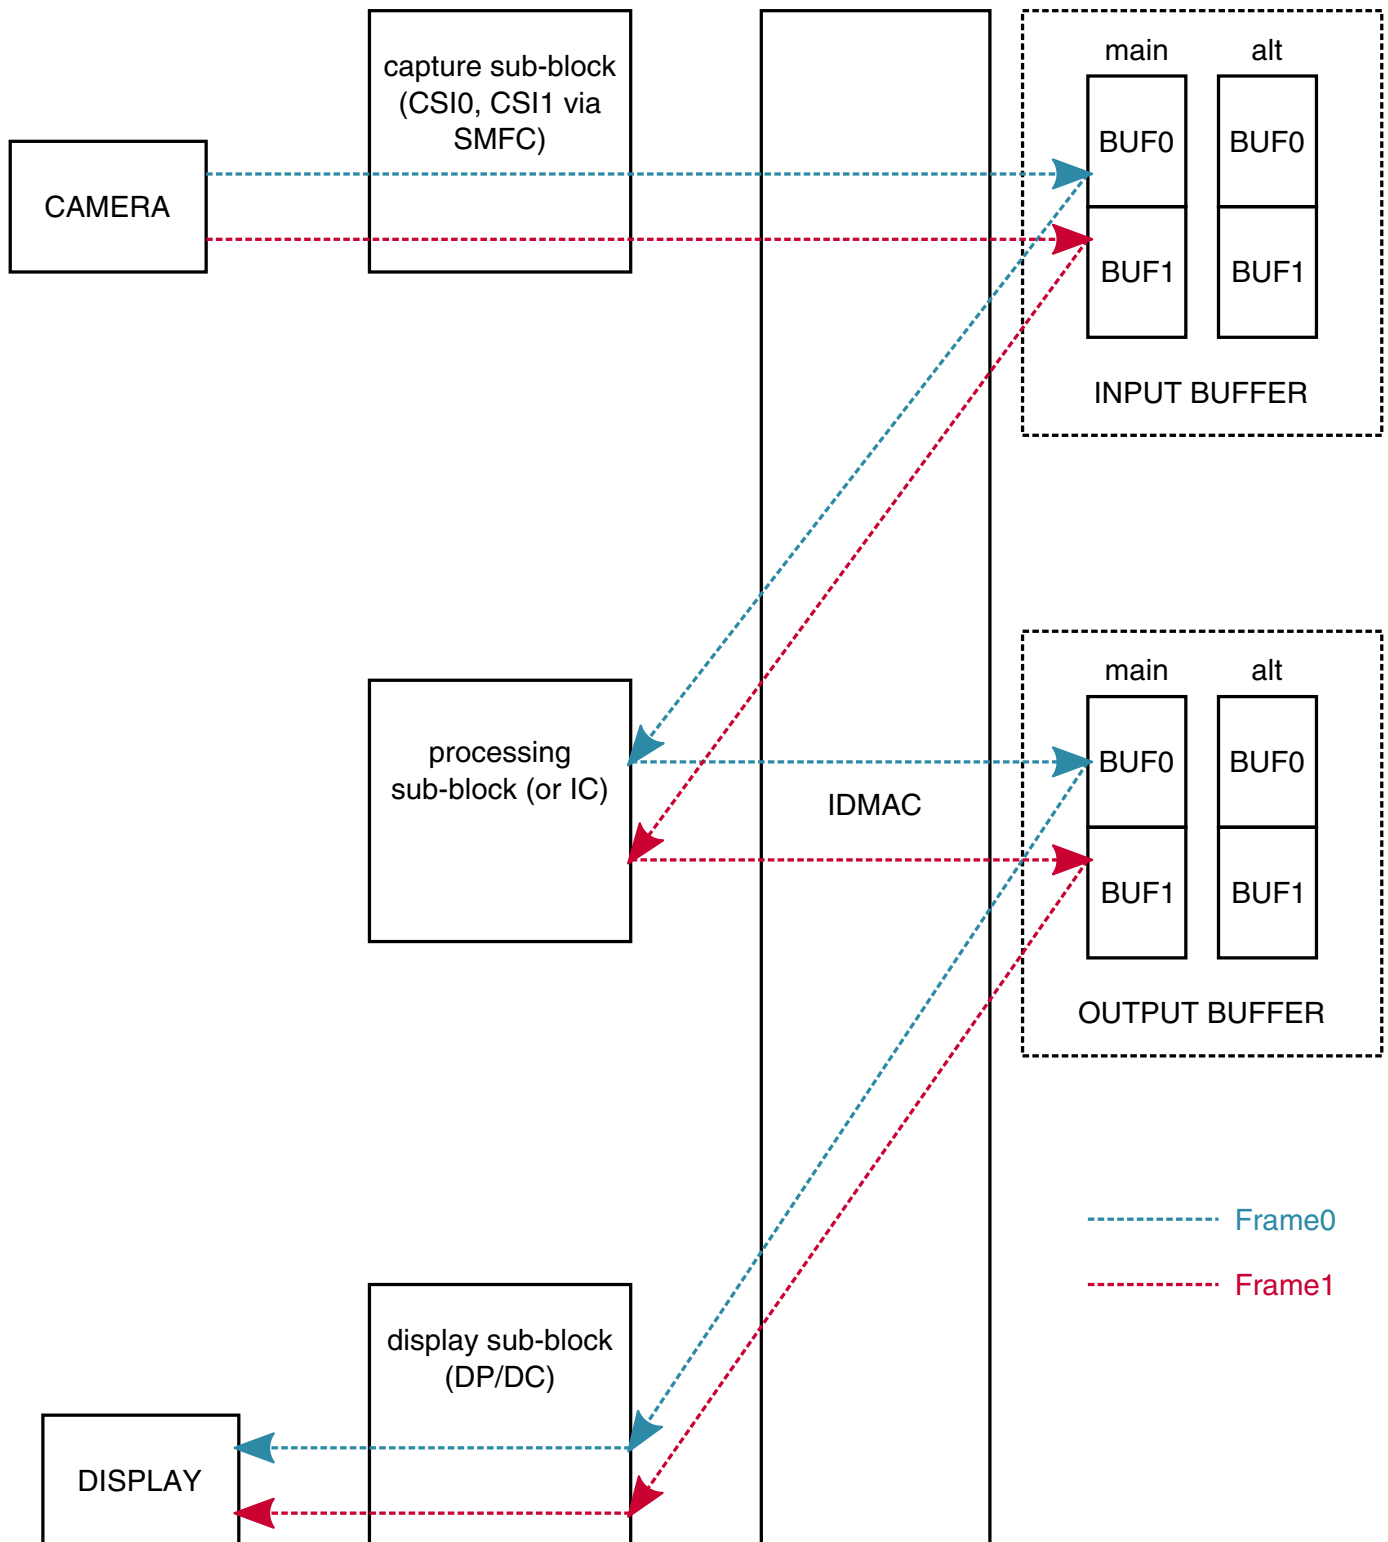

Figure 37-55. IPU tasks' chaining illustration - single flow

IPU task chaining - double flow

The diagram below illustrates task chaining in the In this example double flow is handled. In addition to the flow described on the previous example, another flow is handled via the display sub-blocks. In that case the DC will handle 2 flows. Once sending Frame0 to the display is complete, the FSU will decide in whether to handle Frame1 or Frame0_ALT. The decision is made according the readiness of the other buffers in the memory, in case of 2 ready buffers (main flow and alternate) the FSU will switch between them in a round robin fashion.

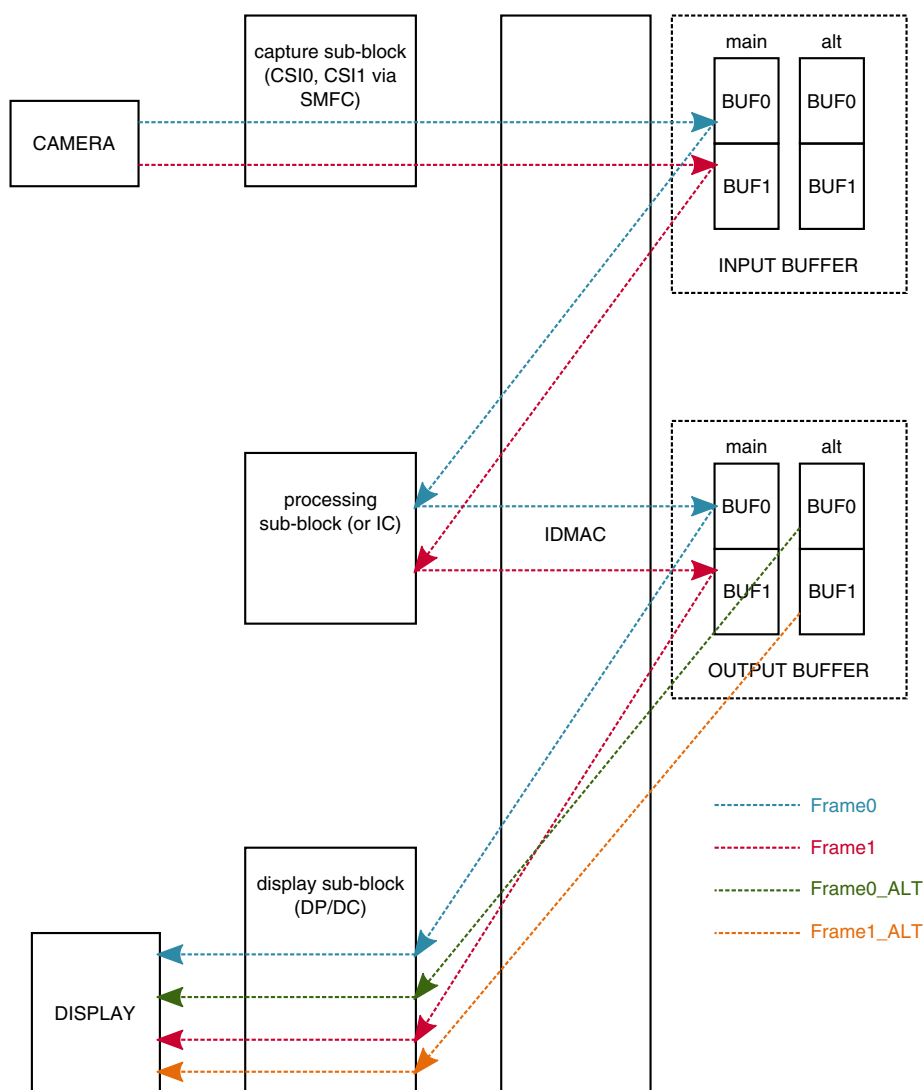

Figure 37-56. IPU tasks' chaining illustration - double flow

37.4.12.2.4 IPU main flows

IPU's flows can be partitioned into 5 groups.

- CF - capture flows

- PF - processing flows
- SF - synchronous display flows
- AF - Asynchronous display flows
- DF - Direct flow from IC to the display

Tasks from different groups can be chained as illustrated below.

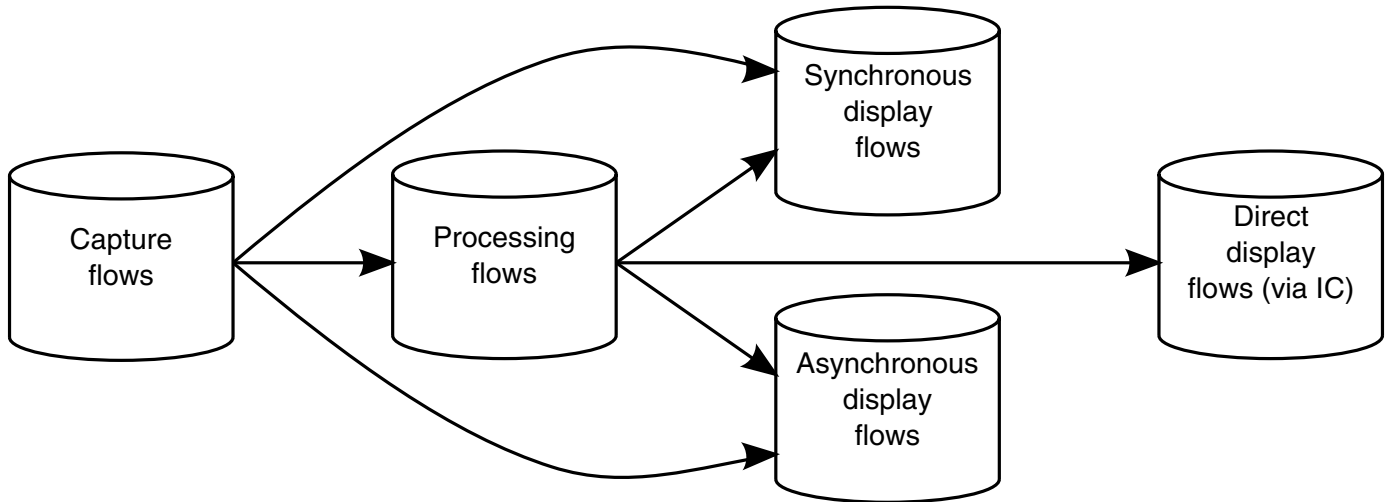

Figure 37-57. IPU task flows chaining

The tables below describe the most important use cases of chaining the IPU tasks. The tables show the main task for each group.

The physical DMA channel is the DMA channel that is used for the main flow - this is the IDMAC channel that is physically connected to the block - the CPMEM parameters should be configured according to the physical channel number. In case of an alternate flow then an alternate entry in the CPMEM should be configured as well

The following table describes capturing flows where data is captured from the sensor and sent to the memory without processing. This flows can be chained to the processing and display flows described on: [Table 37-31](#), [Table 37-32](#), [Table 37-33](#) and on [Table 37-34](#).

Table 37-30. IPU's capture flows

| | Flow | Tasks chain | Physical DMA Channels | | |
|--|--|-------------------------------|-----------------------|-------------|--|
| | | | Video Input | Other Input | Output |
| | Capturing image from sensor and storing it in the memory (via SMFC) without processing | CSI0 or CSI1 --> SMFC --> MEM | --- | --- | IDMAC_CH_0 IDMAC_CH_1 IDMAC_CH_2 IDMAC_CH_3 |

Table continues on the next page...

Table 37-30. IPU's capture flows (continued)

| | Flow | Tasks chain | Physical DMA Channels | | |
|--|---|--|-----------------------|---------------------------|---------------------------|
| | | | Video Input | Other Input | Output |
| | Capturing image from sensor and storing it in the memory (via IC) without processing | CSI0 or CSI1 --> MEM | --- | --- | IDMAC_CH_5 |
| | Capturing interlaced input and storing it in the memory (via VDIC) while performing video de-interlacing in the VDIC. | CSI0 or CSI1 -> VDIC --> MEM | | IDMAC_CH_9 IDMAC_CH_10 | IDMAC_CH_5 IDMAC_CH_13 |
| | | Interlaced input coming from one of the CSIs is sent to the memory without processing via channel #13. In addition 2 more inputs are read from the memory via channels 9 and 10. The processed image is written to the memory via ch 5 in progressive scan mode. | | | |

NOTE

Register IPUx_SMFC_MAP is used to map CSI0 and CSI1 inputs to one of the four IDMAC channels. See [Sensor Multi FIFO Controller \(SMFC\)](#) for additional information.

The following table describe processing flows via the IC . This flows can start from the memory, can be chained to a capturing flow described on [Table 37-30](#). The target of this flow can be chained to the display flows described on [Table 37-32](#) and on [Table 37-33](#).

Table 37-31. IPU's Processing flows

| | Flow | Tasks chain | Physical DMA Channels | | |

**Table 37-32. IPU synchronous display flows
(continued)**

| | Flow | Tasks chain | Physical DMA Channels | | |
|--|--|---|-----------------------------|-----------------------|--------|
| | | | Video Input | Other Input | Output |
| | Synchronous display refresh via DP + combining in the DP | MEM --> DP SYNC(BG/FG) | IDMAC_CH_23 | IDMAC_CH_27 | --- |
| | | Comment: IDMAC_CH_23 is the main channel; IDMAC_CH_27 is used for combining of another plane. | | | |
| | Synchronous display refresh via DP | MEM --> DP SYNC(BG/FG) | IDMAC_CH_23/ IDMAC_CH_27 | IDMAC_CH_44 (mask) | --- |
| | | Comment: IDMAC_CH_23 is the main channel; IDMAC_CH_27 is optional and can be used for combining of another plane. IDMAC_CH_44 is an optional mask Channel | | | |

The following table describes the asynchronous display flows, this flows can be chained to the capture, processing and direct flows described on [Table 37-30](#), [Table 37-30](#) and on [Table 37-34](#)

Table 37-33. IPU Asynchronous display flows

| | Flow | Tasks chain | Physical DMA Channels | | |
|--|--|--|-----------------------------|--------------------------|--------|
| | | | Video Input | Other Input | Output |
| | Asynchronous display refresh via DP | MEM --> DC | IDMAC_CH_24 | --- | --- |
| | Asynchronous display refresh via DP | MEM --> DC | IDMAC_CH_24/ IDMAC_CH_29 | --- | --- |
| | | Comment: IDMAC_CH_29 is another input to the DP to be combined with data coming from IDMAC_CH_24 | | | |
| | Asynchronous display refresh via DP in command buffer mode | MEM --> DC | IDMAC_CH_24/ IDMAC_CH_29 | IDMAC_CH_42 (command) | --- |
| | | Comment: IDMAC_CH_29 is another input to the DP to be combined with data coming from IDMAC_CH_24 | | | |
| | Asynchronous display refresh via DC | MEM --> DC | IDMAC_CH_28 | --- | --- |
| | Asynchronous display refresh via DC | MEM --> DC | IDMAC_CH_41 | --- | --- |
| | Asynchronous display refresh via DC | MEM --> DC | IDMAC_CH_28 | IDMAC_CH_42(command) | --- |
| | | Comment: IDMAC_CH_42 can be optionally used as command channel associated with IDMAC_CH_28 | | | |
| | Asynchronous display refresh via DC | MEM --> DC | IDMAC_CH_41 | IDMAC_CH_43(command) | --- |
| | | Comment: IDMAC_CH_43 can be optionally used as command channel associated with IDMAC_CH_41 | | | |

Table continues on the next page...

**Table 37-33. IPU Asynchronous display flows
(continued)**

| | Flow | Tasks chain | Physical DMA Channels | | |
|--|--|--|-----------------------|--------------------------|-------------|
| | | | Video Input | Other Input | Output |
| | Asynchronous display refresh via DP | MEM --> DP ASYNC | IDMAC_CH_24 | IDMAC_CH_42(command) | --- |
| | | Comment: IDMAC_CH_42 can be optionally used as command channel associated with IDMAC_CH_24 | | | |
| | Asynchronous display refresh via DP | MEM --> DC | IDMAC_CH_24 | IDMAC_CH_43 (command) | --- |
| | | Comment: IDMAC_CH_43 can be optionally used as command channel associated with IDMAC_CH_24 | | | |
| | Reading data from asynchronous display | DC --> MEM | --- | --- | IDMAC_CH_40 |
| | | | | | |

The table below describes direct flows via the IC. These are processing flows via the IC where the output is sent directly to the DMFC. Direct camera to display flow is possible when the frame rate of the source and the destination is the same (typically the target display will be asynchronous display, where the display is updated at the rate of the source). From that point, any of the display flows described on [Table 37-32](#) and on [Table 37-33](#) can be chained.

Table 37-34. IPU direct flows to the display via the IC

| | Flow | Tasks chain | Physical DMA Channels | | |
|--|--|-------------------------------|-----------------------------|-----------------------|--|
| | | | Video Input | Other Input | Output |
| | Rotation and preprocessing of image from sensor for viewfinder and displaying it on synchronous display via DP | CSI0 or CSI1 --> SMFC --> MEM | --- | --- | IDMAC_CH_0 IDMAC_CH_1 IDMAC_CH_2 IDMAC_CH_3 |
| | | MEM --> IC (ROT VF) --> MEM | IDMAC_CH_46 | --- | IDMAC_CH_49 |
| | | MEM --> IC (PRP VF) --> DMFC | IDMAC_CH_12 | IDMAC_CH_14 | Direct to the DMFC |
| | | MEM --> DP SYNC (BG/FG) | IDMAC_CH_23/ IDMAC_CH_27 | IDMAC_CH_44 (mask) | --- |

Table continues on the next page...

Table 37-34. IPU direct flows to the display via the IC (continued)

| | Flow | Tasks chain | Physical DMA Channels | | |
|--|--|--|-----------------------------|--|--|
| | | | Video Input | Other Input | Output |
| | Rotation and preprocessing of image from sensor for viewfinder and displaying it on asynchronous display via DP | CSI0 or CSI1 --> SMFC --> MEM | --- | --- | IDMAC_CH_0 IDMAC_CH_1 IDMAC_CH_2 IDMAC_CH_3 |
| | | MEM --> IC (ROT VF) --> MEM | IDMAC_CH_46 | --- | IDMAC_CH_49 |
| | | MEM --> IC (PRP VF) --> DMFC | IDMAC_CH_12 | IDMAC_CH_14 | Direct to the DMFC |
| | | MEM --> DP SYNC (BG/FG) | IDMAC_CH_24/ IDMAC_CH_29 | command channel | --- |
| | Preprocessing image from sensor for viewfinder and direct displaying it on asynchronous display | CSI0 or CSI1 --> SMFC --> MEM | --- | --- | IDMAC_CH_0 IDMAC_CH_1 IDMAC_CH_2 IDMAC_CH_3 |
| | | MEM --> IC (PRP VF) --> DC | IDMAC_CH_12 | IDMAC_CH_14 | --- |
| | Preprocessing image from sensor for viewfinder and direct displaying it on asynchronous display | CSI0 or CSI1 --> IC (PRP VF) --> DC | --- | IDMAC_CH_14 | IDMAC_CH_21 |
| | Preprocessing image from sensor for viewfinder and direct displaying it on asynchronous display via DP | CSI0 or CSI1 --> IC (PRP VF) --> DP ASYNC | --- | IDMAC_CH_14 | IDMAC_CH_21 |
| | Capturing interlaced input via CSI, then perform video de-interlacing in the VDIC. Then processing in the IC and direct displaying it on asynchronous display via DP | CSI0 or CSI1 -> VDIC --> IC (PRP VF) --> DP ASYNC | -- | IDMAC_CH_9 IDMAC_CH_10 IDMAC_CH_14 | IDMAC_CH_13 IDMAC_CH_21 |
| | | Interlaced input coming from one of the CSIs is sent to the memory without processing via channel #13. In addition 2 more inputs are read from the memory via channels 9 and 10. The processed image is sent to the IC for further processing then it is sent to the display | | | |
| | Capturing interlaced input via CSI, then perform video de-interlacing in the VDIC. Then processing in the IC and direct displaying it on asynchronous display | CSI0 or CSI1 -> VDIC --> IC (PRP VF) --> DC | -- | IDMAC_CH_9 IDMAC_CH_10 IDMAC_CH_14 | IDMAC_CH_13 IDMAC_CH_21 |
| | | Interlaced input coming from one of the CSIs is sent to the memory without processing via channel #13. In addition 2 more inputs are read from the memory via channels 9 and 10. The processed image is sent to the IC for further processing then it is sent to the display | | | |

37.4.12.2.5 Sub-Frame Double-Buffering (Band Mode)

Page-flip double buffering is performed using full-frame buffers.

In addition IPU supports also page-flip double buffering using smaller buffers, each containing 4/8/16/32/64/128/256 rows of pixels. This allows the use of internal memory for buffering.

This mode can be supported by the following modifications (relative to full-frame buffers):

The address in system memory is generated by the same formula, but inserting the full row number, only k LSB's (for a band of 2^k rows) are inserted (e.g. [2:0] for 8 rows).

Page flip is triggered at the end of each band (when the k LSB's are all 1) and not only at the end of the frame. This flip may be accompanied by an ARM/SDMA interrupt, if synchronization with other modules (e.g. VPU or ARM) is needed.

The channels that can work in this mode are controlled by the corresponding IDMAC_BNDM_EN_<i>

bit. The BNDM parameter of the corresponding IDMAC channel has to be set as well.

37.4.12.2.6 Automatic Window Refresh

By programming the <>_SRC_SEL bits of the corresponding flow to autoref mode, automatic refresh of a window on the smart display is enabled. This means that the flow is triggered any time the refresh counter completes its counting. The refresh period is defined via the AUTOREF_PER field (the time unit is 2^{17} periods of the HSP_CLK clock).

The actual value of refresh period is equal to:

$$T_{HSP} * 2^{17} * (AUTO_REF_PER + 1).$$

37.4.12.2.7 IPU VDOA synchronization

IPU can interact to a companion block called VDOA.

VDOA (Video Data Order Adapter) is used to re-order video data from the "tiled" order used by the VPU to the conventional raster-scan order needed by the IPU.

The VDOA can transfer its output to the IPU through internal memory, containing a band double buffer.

This tight double-buffering synchronization is performed without MCU involvement, using dedicated signals between the VDOA and IPU and the same protocol as used between two IPU DMA channels.

VDOA notifies the IPU which is the current band to read. IPU notifies the VDOA when the current band is read.

This synchronization is supported for VDI and IC(PP). The target destination of the VDOA data is defined by VDOA_DEST_SEL parameter. The PP_SRC_SEL or VDI_SRC_SEL has to be programmed as well to select VDOA as the source of the task.

For more details about IDMAC's band mode support [Sub-Frame Double-Buffering \(Band Mode\)](#).

The IPU settings and the VDOA settings has to be the same. In particular

- The band height defined at the IPU and at the VDOA must match
- The Number of Frames used by the VDI as defined by the VDI_MOT_SEL has to match the VDOA settings.

37.4.12.3 Interrupt Generator

The IG produces two interrupts to the ARM platform - the functional interrupt and the error interrupt. All of the interrupts are maskable.

The following table describes the functional interrupts.

Table 37-35. Functional Interrupts Summary

| Location | Sub-blocks | Interrupt status bit name | Description |
|--------------------|------------|---------------------------|-------------|
| IPU_INT_STAT_1[0] | IDMAC | IDMAC_EOF_0 | - |
| IPU_INT_STAT_1[1] | IDMAC | IDMAC_EOF_1 | - |

The table below describes the error interrupts. The panic column indicates if this signal is part of the logic generating the ipu_panic signal. The ipu_panic signal can be used for indicating about errors that are result of data rate problems. Such problems may be a

result of the IPU running in slower clock than required by the use case. This signal can be used in order to indicate the system that the IPU can't handle the desired data rate. In that case the system may need to increase the clock to the IPU or simplify the use case.

Table 37-36. Error Interrupts Summary (continued)

| Location | Sub-blocks | Interrupt Status name | panic | Description |
|--------------------|------------|-----------------------|-------|-------------|
| IPU_INT_STAT_5[0] | IDMAC | IDMAC_NFB4EOF_ERR_0 | YES | - |
| IPU_INT_STAT_5[1] | IDMAC | IDMAC_NFB4EOF_ERR_1 | YES | - |
| IPU_INT_STAT_5[2] | IDMAC | IDMAC_NFB4EOF_ERR_2 | YES | - |
| IPU_INT_STAT_5[3] | IDMAC | IDMAC_NFB4EOF_ERR_3 | YES | - |
| IPU_INT_STAT_5[5] | IDMAC | IDMAC_NFB4EOF_ERR_5 | YES | - |
| IPU_INT_STAT_5[8] | IDMAC | IDMAC_NFB4EOF_ERR_8 | YES | - |
| IPU_INT_STAT_5[9] | IDMAC | IDMAC_NFB4EOF_ERR_9 | YES | - |
| IPU_INT_STAT_5[10] | IDMAC | IDMAC_NFB4EOF_ERR_10 | YES | - |
| IPU_INT_STAT_5[11] | IDMAC | IDMAC_NFB4EOF_ERR_11 | YES | - |
| IPU_INT_STAT_5[12] | IDMAC | IDMAC_NFB4EOF_ERR_12 | YES | - |
| IPU_INT_STAT_5[13] | IDMAC | IDMAC_NFB4EOF_ERR_13 | YES | - |
| IPU_INT_STAT_5[14] | IDMAC | IDMAC_NFB4EOF_ERR_14 | YES | - |
| IPU_INT_STAT_5[15] | IDMAC | IDMAC_NFB4EOF_ERR_15 | YES | - |
| IPU_INT_STAT_5[17] | IDMAC | IDMAC_NFB4EOF_ERR_17 | YES | - |
| IPU_INT_STAT_5[18] | IDMAC | IDMAC_NFB4EOF_ERR_18 | YES | - |
| IPU_INT_STAT_5[20] | IDMAC | IDMAC_NFB4EOF_ERR_20 | YES | - |
| IPU_INT_STAT_5[21] | IDMAC | IDMAC_NFB4EOF_ERR_21 | YES | - |

37.4.12.4 SDMA event generator

The IPU provides an SDMA event signal that can be used as trigger to the SoC's SDMA. IPU routes an internal event to the SDMA event signal. The internal event causing the assertion of the SDMA signal is enabled by setting the corresponding bit on the SDMA_EVENT_# registers.

The user is allowed to enable multiple events. When one of these events occurs the ipu_sdma_event signal will be asserted. Similar to interrupts, the ipu_sdma_event signal is cleared by writing one to the corresponding bit in the INT_STAT_# registers.

It is not recommended to use the same internal event for a simultaneous generation of an interrupt signal and an SDMA event. This will require special software care when clearing the corresponding bit in the INT_STAT_# registers.

37.4.12.5 General Configuration Registers

The GCR contains a set of control/status/data registers. It provides IPU interface to the AHB slave bus.

The HCLK rate is equal to the HSP_CLK rate. The detail description of the registers is found in the Programmable Registers section.

37.4.12.6 Shadow Registers Module (SRM)

IPU supports frame by frame task switching. This means that a sub-block can handle a frame with one configuration and handle the following frame with different configuration. Changing the configuration is done by updating the sub-block's parameters.

In order to allow automatic flow without a need of the SW to update all the parameters at the frame boundaries. A Register of a sub-block that has the shadowing capabilities has a shadow register file that resides in the Shadow Register Memory.

The sub-blocks supporting this function may use it in one of the following ways:

37.4.12.6.1 Switching between 2 flows

Upon request from the FSU the SRM switches between the registers and the content in the Shadow Register Memory. When a sub-block uses one of the configuration SW, it is allowed to update the parameters in the memory. This is normally used when 2 flows are supported via one module.

- The current flow's configuration is stored in the module's registers
- The alternate flow configuration is stored in the SRM.
- When switching between flows the current flow's configuration is stored in the SRM. The alternate flow's configuration is written to the module's registers. When the alternate flow ends the configurations are swapped again.

This process is fully controlled by the FSU

37.4.12.6.2 Updating parameters between frames

This mode is used when the user needs to update the parameters of the current task being processed by the module. The updates can't affect the frame that is currently being processed. The update is effective only on the next frame. The SRM performs the parameters update only when there's a specific request by the user.

- The current frame's configuration is stored in the sub-block's registers
- The next frame's configuration is stored in the SRM.
- On frame's boundary the SRM reads the new configuration from the SRM and writes it to the sub-block's registers. The old configuration is lost.

37.4.12.6.3 Updating the memory

In order to avoid data coherency problems, the user should set a flag indicating that he is currently updating the memory region of a specific sub-block. When the flag is set the SRM will not attempt to replace the parameters relevant to the specific sub-block currently being updated by the user.

The user should clear this flag when he completes the update, and the parameters are ready to be used.

The flag is the corresponding **SRM_MODE** field for each sub-block. This field controls the SRM logic that handles the sub-blocks registers

- 00 - ARM platform is allowed to access the sub-block's region in the RAM; The automatic swapping mechanism is disabled.
- 01 - The SRM logic is controlled by the FSU. The update will be done of the next frame.
- 10 - The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame
- 11 - Update now. The SRM is controlled by the ARM platform. The Register will be update now

Each sub-block uses the SRM mechanism according to the sub-block's behavior, the table below summarizes the SRM support for each sub-block

Table 37-37. SRM support per Sub-block

| Sub-block | Switching between 2 flows support | Updating parameters between frames | Comment |
|------------|-----------------------------------|------------------------------------|---|
| CSI1, CSI0 | NO | YES | SRM_MODE can be 00 or 01. The update will happen only once. When set to 01: after the update the state machine is automatically moved to 00 mode. It is recommended to make sure that the first frame has started by polling the corresponding NFACK bit before setting the SRM_MODE |
| DI1, DI0 | NO | YES | DI0, DI1 parameters are needed when clock change is performed (Clock Change procedure). SRM_MODE can be 00 or 01. The update will happen only once. When set to 01: after the update the state machine is automatically moved to 00 mode |
| DC | YES | NO | SRM_MODE can be 00 or 10. |
| DP | YES | NO | SRM_MODE can be 00, 10 or 11. When set to 11: after the update the state machine is automatically moved to 10 mode 10 is not supported for SYNC flows |

In order to update parameters the user should monitor the SRM_BUSY bit of the corresponding sub-block. When the SRM is not busy the user should set the **SRM_MODE to 00. The user will now update the register file in the memory. When done the user should switch the SRM_MODE field to the desired mode.**

37.4.12.6.4 SRM priority

The SRM updates the registers according to a pre defined priority. The priority is set according to the SRM_PRI bits of each sub-block. The user must set a unique value for each sub-block.

37.4.12.6.5 SRM entries mapping

The table below maps any IPU register to an address in the SRM. The registers marked as NONE do not have an SRM entry

PG column indicates if this register is saved during power gating mode

LPSR column indicates if this register is swapped during low power screen refresh mode (LPSR)

Table 37-38. IPU SRM entries mapping

| Register's name | Register's address | SRM entry | PG | LPSR |
|-------------------|--------------------|-----------|-----|------|
| IPU_CONF | 0x0000_0000 | NONE | YES | NO |

37.4.12.7 Memory Access Unit

The Memory Access Unit (MA) supports ARM platform access to the IPU internal memories.

Some of the IPU internal memories are memory mapped. This unit handles accessing these memories. The table below describe the accessible memories and their limitations.

Table 37-41. Internal Memories Access Support and Limitations

| Memory | Function | Support and Limitations |
|-------------|----------------------------------|---|
| lut | IDMAC's look up table | Accessible only when All the IDMAC channels that use the LUT are disabled |
| cpmem | IDMAC's Channel parameter Memory | This memory can be accessed while tasks are enabled. Must be configured before enabling processing tasks. IDMAC channel parameters must not be changed in the CPM when the corresponding DMA channel is enabled excluding the base addresses (EBA0 and EBA1). One of these parameters can be changed during channel operation if it relates to the non-active double buffer. |
| tpm | IC's task parameter memory | Must be configured before enabling processing tasks. This memory can be accessed while tasks are enabled. IC task parameters must not be changed in the TPM when the corresponding task is active. |
| dc_template | DC's template memory | Can be configured before enabling tasks. Must not be accessed while operation. Both read and write access to the DC's template memory are forbidden when there is any enabled channel which can use the template |

37.4.12.8 SISG - Still Image Synchronization Generator

The IPU includes a "Still Image Synchronization Generator" (SISG), providing time-sensitive control signals synchronizing the image sensor with camera peripherals, such as a flash lamp and a mechanical shutter.

The SISG is implemented using a single time base counter, and six Time Compare Units - as described in the following figure.

Figure 37-58. Still Image Signal Generator

The SISG inputs are:

- Activation trigger
- VSYNC: the frame-boundary signal from the sensor

The SISG is activated by one of the following triggers:

- The ARM platform by setting the MCU_ACTV_TRIG bit
- A signal generated by an appropriate short packet received through the MIPI/CSI-2 I/F
- An external signal (GPIO pin)

Upon activation, the counter is reset and then there are the following two possibilities:

- Counting starts immediately
- Counting start is delayed until one of the next 7 VSYNC signals (programmable via the NO_OF_VSYNC bits)

During the counting period, the SISG can generate up to 6 output strobes:

- Each strobe can be individually enabled or disabled and has a programmable polarity

- The edges of the strobes are generated at specified counter values - to achieve pixel-level resolution - as specified by programmable SISG_SET& SISG_CLR time tag registers
- The clock has 25 bits, to allow strobe generation during a time period of up to two 12M pixel frames

The SISG can repeat the above sequence for up to 32 cycles (this is provided to generate a train of flash pulses, for anti-red-eye or for measurements in low-light conditions). The repetition is implemented by resetting the counter, which can be triggered by one of the following events:

- A VSYNC signal
- A pre-defined value reached by the counter

After the last sequence, when the counter reaches its maximal value, it stops counting and the SISG remains in idle mode until the next activation.

37.4.12.9 Clock Change procedure

The IPU supports dynamic clock rate changes.

Types of change:

- DVFS transitions: frequent, initiated by the SoC's power modes controller (GPC) and the SoC's clock controller module (CCM)
- Other: infrequent, initiated by SW.

IPU may have on-going activities at this stage.

The display interface clocks may either change or remain unchanged. During screen refresh, the display clock would typically not change. During asynchronous access, it may be appropriate to change also the display interface clock. The choice between these options would be made in advance by the user

If the IPU display interface uses the external clock (DI0_DISP_CLK - ipp_di_0_ext_clk or DI1_DISP_CLK - ipp_di_1_ext_clk) source, it remains unchanged. A change in the rate of this clock is performed fully by SW, without the special HW support described below. In particular, the SW may have to stop explicitly any interaction with the display (e.g. screen refresh) before performing the change.

The user is responsible to make sure that the lowest planned clock (in DVFS transitions) is still high enough to support the expected activities (e.g. data rate through the display bus)

The procedure below describes the IPU handshaking with the CCM.

1. The user prepares 2 sets of clock modes `CLOCK_MODE_0` is the default clock mode, `CLOCK_MODE_1` is the alternate clock mode. The IPU toggles between these two settings following the next assertion of `ipg_clk_change_rq`. If the user sets the `SRM_CLOCK_CHANGE_MODE` bit then he should also prepare the registers in the SRM for each of the DIs. These registers include all the DI settings adjusted to the new clock.
2. CCM asserts the `ipg_clk_change_rq` signal when a clock change is needed
3. The CM calculates the new clock frequency and send it to the DI (signals are `di0_clk_freq`, and `di1_clk_freq`). These signals should be sent to the DI only after getting the `di_clk_change_ack` signal from the DIs. The values of this field could be.
 - 00 - 1/4 of full frequency
 - 01 - 1/2 of full frequency
 - 10 - full frequency
 - 11 - illegal
4. The CM sends a `cm_clk_change_rq` signal to the DIs.
5. The DI stops the clock to the display (freeze mode) according to `DI0_CLOCK_STOP_MODE` & `DI1_CLOCK_STOP_MODE` bits. If the DI is disable, the ACK from the DI is not needed and the CM will assume that the DI sent an ACK.
6. Once the clock to the display is stopped, the DI sends a signal to the CM called `di_clk_change_ack`
7. The CM wait for the clock change signals from both of the DIs
8. If the `SRM_CLOCK_CHANGE_MODE` bit is set the CM should read the new DI settings from the SRM and override the previous DI settings. Then the CM clears the `SRM_CLOCK_CHANGE_MODE` bit
9. Once the above is complete the CM asserts the `ipg_clk_change_ack` signal to the CCM
10. The CM sends the signals `di0_clk_freq`, and `di1_clk_freq` to the DIs.
11. The CCM will negate the `cm_clk_change_rq`
12. The CCM will now change the clocks
13. When the new clock arrives the `ipu_clk_changed` signal will be asserted.
14. The state machine on each DI will now move out of freeze mode and continue working with the new clock.

37.4.12.10 Low Power Modes

IPU supports the following low power modes.

- STOP: on this mode the clock to the IPU is stopped
- LPSR: low power screen refresh. The clock to the IPU is changed to a slower frequency, the IPU performs only screen refresh.

The user should not request LPSR. at the same time. This case is not supported and the results are not predictable.

The CCM may assert one of the 2 signals: stop_clk_at_stop_req OR stop_clk_at_wait_req

The IPU OR them internally as there's no difference between them with regards to IPU's behavior.

In all these modes the clock to the IPU is going to be stopped (assertion of stop_clk_at_stop_req).

IPU should complete all his tasks:

- CSIs complete transferring the last frame. Wait for csi_busy = 0
- IDMAC completes all the flows (all CH_BUSY = 0)
- All the flows in the FSU are complete. New ones do not start.
- CM sends stop request to the DIs
- Once the DI sent all the data to the display, it asserts an ACK signal

Only when all the above occurs, the CM can assert an internal signal called "IPU_IDLE"

IPU_IDLE is the starting point for any of the low power modes.

Note that if the VDIC was in use prior to entrance the low power mode the viewfinder task of the IC will be in WAIT_FOR_READY state (the task's status is reflected in the VF_TSTAT field). The user will need to manually switch that task to IDLE. This is done by performing the following steps:

- Wait for EOF of the viewfinder output channel (IDMAC_EOF_21)
- Set RSW_EN bit
- resume one frame via the viewfinder task.
- Disable the VDI and IC and the corresponding IDMAC channels

37.4.12.10.1 STOP Mode

In this mode the IPU sends the ipu_stby_ack after getting to IPU_IDLE state. The CCM will gate off the clock to the IPU.

Figure 37-59. Entering and Exiting STOP Mode

Wake up from STOP mode

When the SoC decides to wake up from STOP mode it should:

- Resume the clock to the IPU.
- Negate the stop_clk_at_stop_req or stop_clk_at_wait_req signal.
- The IPU will then negate the ipu_stby_ack signal.
- The IPU will resume screen refresh.

37.4.12.10.2 Low Power Screen Refresh mode - LPSR

In Low Power Screen Refresh mode, the clock to the IPU is changed to a slower frequency, the IPU performs only screen refresh to a single display via the DP (channels 23 & 27).

Preparations

1. The user sets the LPSR_MODE bit indicating that the next assertion of stop_clk_at_stop_req OR stop_clk_at_wait_req activates the LPSR procedure.
2. The user moves the IPU to screen refresh flow. This means that if other tasks are active (flows via CSI or multiple flows to multiple displays) - this tasks needs to be complete and disabled. This is step is fully done by the user (SW). The only flow that remains active is screen refresh to a single display done via the DP (channels 23 & 27)
3. The user stores in the SRM the planned configuration for the sub-blocks involved in the LPSR flow. These configuration will e switched with the active registers' settings on later stage. The relevant sub-blocks are:
 - DI0 & DI1
 - DC
 - DP
 - DMFC
 - IDMAC
 - CM

Entering LPSR

The flow for entering LPSR is the same as stop mode.

1. The IPU follows the same procedure as on STOP mode till getting into IPU_IDLE state.
2. IPU swaps the registers of the relevant blocks with the pre stored content from the SRM. The content of the registers of the current flow is stored in the SRM. The IPU will switch back to this configuration after exiting from LPSR.
3. The IPU sends the ipu_stby_ack
4. The CCM will gate off the clock to the IPU.
5. The CCM will switch to the new clock
6. After changing the clock, the CCM asserts ccm_lpsr_ipu, this signal is synched inside the IPU to the hsp_clk
7. The IPU will resume screen refresh with the new settings.

Exit from LPSR

1. The CCM negates ccm_lpsr_ipu
2. The CM sends standby request to the DI
3. The DI should complete processing the current frame and stop the clock to the display and send an acknowledge signal to the CM.
4. The SRM swaps the registers' configuration. current configuration (LPSR) is saved in the SRM, the previous (original) configuration is stored in the blocks' registers.
5. IPU asserts the ipu_wakeup_ack signal indicating that it is now safe to leave LPSR mode.
6. CCM stops the clocks to IPU
7. CCM resumes the clock to the IPU - This clock is the same clock used prior to entering the LPSR mode.
8. CCM negates the stop_clk_at_stop_req (or stop_clk_at_wait_req)
9. IPU negates the ipu_stby_ack and the ipu_wakeup_ack signals
10. The IPU resumes screen refresh with the original settings.

The diagram below illustrates the procedure for entering and leaving LPSR mode

Functional Description

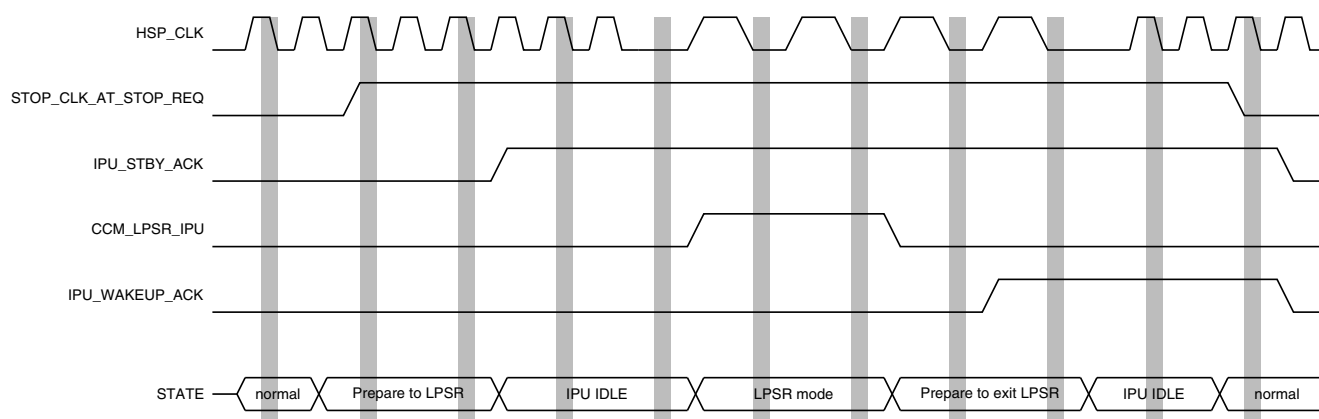

Figure 37-60. Entering and Exiting LPSR mode

37.4.13 IPU diagnostics unit

The IPU has a 16 bit diagnostic bus called ipu_diagbus. This bus can be connected at SoC level so these 16 outputs of the IPU can be routed to the SoC's pins and used for signals monitoring during debug.

The internal signals that can be monitored are internal status signals. There are 18 groups of signals. In order to route the selected group the user need to set the IPU_DIAGBUS_MODE and select the correct group. The sub-blocks are arranged in groups as described on the tables below.

Table 37-42. IPU diag bus groups 0-3

| | group0 | group1 | group2 | group3 |
|----|-----------------------|------------------|----------------------------|-----------------------|
| 0 | IDMAC_NFACK_6 | DC_TEARING_ERR_6 | IDMAC_EOF_40 | IDMAC_EOF_5 |

37.5 IPU Memory Map/Register Definition

The address space for accesses through the AHB-lite slave port is 4 MB and it is split internally (with 2MB resolution) according to bit [21] of the address. Using the following notation

Address = (IPU_ID[31:25], 1,1,1,MSB[21], LSB[20:0])

the address is used as follows :

1. MSB=0: Low-level access to an external device, with LSB[3:0] = (Lock, CS, RS[1:0])
 - LSB[5:4] = RS[1:0] (the address on the display interface)
 - LSB[6] = Choice of display's channel (0=channel 8, 1=channel 9)
 - LSB[7] = Lock (Lock=1 prevents the use of the display port until the next ARM platform access)
1. MSB=1: access to internal IPU registers, with address LSB

NOTE

The addresses given in the table are relative to the IPU base address defined at SoC's level.

IPU memory map

| Absolute address (hex) | Register name | Width (in bits) | Access | Reset value | Section/ page |

IPUx_CONF field descriptions

| Field | Description |
|------------------------|--|
| 31 CSI_SEL | CSI select bit; This bit selects manually between the 2 CSI's. This bit defines which CSI is the input to the IC. This bit is effective only if IC_INPUT is bit cleared 0 CSI0 is selected 1 CSI1 is selected |
| 30 IC_INPUT | IC Input select bit. This bit selects manually between the 2 inputs to the IC 0 CSI0/1 is selected; In order to select between the CSIs use the CSI_SEL bit. 1 VDI |
| 29 CSI1_DATA_SOURCE | CSI1 data Source This bit selects what is the data source for the CSI1. This is a static mux that should not be changed while CSI1 is working. Data is handles differently if the source is MCT (MIPI) or parallel interface. 0 Parallel interface is connected to CSI1 1 MCT (MIPI) is connected to CSI1 |
| 28 CSI0_DATA_SOURCE | CSI0 data Source This bit selects what is the data source for the CSI0. This is a static mux that should not be changed while CSI0 is working. Data is handles differently if the source is MCT (MIPI) or parallel interface. 0 Parallel interface is connected to CSI0 1 MCT (MIPI) is connected to CSI0 |
| 27 VDI_DMFC_SYNC | This bit enables the direct path VDIC -> IC_VF -> DMFC for sync flow. If this bit is set IC_DMFC_SEL must be set. 0 the flow is disabled 1 the flow is enabled |
| 26 IC_DMFC_SYNC | IC to DMFC Sync flow This bit defines if the direct flow between IC to DMFC is synchronous or asynchronous 0 async flow 1 Sync flow |
| 25 IC_DMFC_SEL | IC to DMFC select Selects the DMAIC_1 (channel 21) channel's connectivity between the IC and the DMFC 0 DMAIC_1 (channel 21) is routed to the IDMAC 1 DMAIC_1 (channel 21) is routed to DMFC In case DMFC was selected the IDMAC_CH_EN[21] must be clear. |
| 24 Reserved | This read-only field is reserved and always has the value 0. |
| 23 Reserved | This read-only field is reserved and always has the value 0. |
| 22 IDMAC_DISABLE | Image DMA controller (IDMAC) disable bit. This bit allows the user to turn off the clock of the IDMAC if the use case permits it. By default the IDMAC is enabled. 0 IDMAC is enabled 1 IDMAC is disabled |

IPUx_CONF field descriptions (continued)

| Field | Description |
|---------------------------|---|
| 21 IPU_DIAGBUS_ON | <p>IPU Diagnostics bus on</p> <p>This bit is connected to the IPU's output. it can be used by the SoC in order to control the IOMUX and bring the IPU's diagnostics bus to the SoC's pins.</p> <p>1 diagnostics bus is on 0 diagnostics bus is off</p> |
| 20–16 IPU_DIAGBUS_MODE | <p>IPU diagnostic bus mode.</p> <p>This 5 bits select one of 16 groups of signals to be routed to the IPU's diagnostics bus</p> <p>00000 Route group 0 to the IPU's diagnostics bus 00001 Route group 1 to the IPU's diagnostics bus 01111 Route group 15 to the IPU's diagnostics bus 10000 Route group 16 to the IPU's diagnostics bus 10001 Route group 17 to the IPU's diagnostics bus 10010-11111 Reserved</p> |
| 15–13 Reserved | This read-only field is reserved and always has the value 0. |
| 12 VDI_EN | <p>VDI enable bit. This bit must be cleared if the ISP_EN bit is set.</p> <p>0 VDIC is disabled 1 VDIC is enabled</p> |
| 11 SISG_EN | <p>Still Image Synchronization Generator (SISG) Enable bit</p> <p>0 SISG is disabled 1 SISG is enabled</p> |
| 10 DMFC_EN | <p>Display's Multi FIFO Controller sub-block (DMFC) Enable bit</p> <p>0 DMFC is disabled 1 DMFC is enabled</p> |
| 9 DC_EN | <p>Display Controller sub-block (DC) Enable bit</p> <p>0 DC is disabled 1 DC is enabled</p> |
| 8 SMFC_EN | <p>Sensor's Multi FIFO Controller Sub-block (SMFC) Enable bit</p> <p>0 SMFC is disabled 1 SMFC is enabled</p> |
| 7 DI1_EN | <p>Display Interface Sub-block 1 Enable bit</p> <p>0 DI1 is disabled 1 DI1 is enabled</p> |
| 6 DI0_EN | <p>Display interface Sub-block 0 Enable bit</p> <p>0 DI0 is disabled 1 DI0 is enabled</p> |
| 5 DP_EN | Display processor Sub-block Enable bit |

Table continues on the next page...

IPUx_CONF field descriptions (continued)

| Field | Description |
|---------------|---|
| | 0 DP is disabled 1 DP is enabled |
| 4 Reserved | This read-only field is reserved and always has the value 0. |
| 3 IRT_EN | Image Rotation Sub-Block Enable bit 0 IRT is disabled 1 IRT is enabled |
| 2 IC_EN | Image Conversion Sub-Block Enable bit 0 IC is disabled 1 IC is enabled |
| 1 CSI1_EN | Camera Sensor Interface 1 Enable bit 0 CSI1 is disabled 1 CSI1 is enabled |
| 0 CSI0_EN | Camera Sensor Interface 0 Enable bit 0 CSI0 is disabled 1 CSI0 is enabled |

37.5.3 SISG Control 0 Register (IPUx_SISG_CTRL0)

Address: Base address + 4h offset

| | | | | | | | | | | | | | | | | |
|-------|-----------------------|----------|---------------|-----------------------|----|----|----|----|----|----|----|----|---------------------|----|---------------|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | 0 | EXT_ACTV | MCU_ACTV_TRIG | VAL_STOP_SISG_COUNTER | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | VAL_STOP_SISG_COUNTER | | | | | | | | | | | | NO_VSYNC_2_STRT_CNT | | VSYNC_RST_CNT | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

IPUx_SISG_CTRL0 field descriptions

| Field | Description |
|-----------------------------------|---|
| 31 Reserved | This read-only field is reserved and always has the value 0. |
| 30 EXT_ACTV | External Active Define if an external active trigger will start the counters. The external active trigger is an input signal to the IPU called ext_actv_trig |
| 29 MCU_ACTV_ TRIG | Reserved, should be cleared. |
| 28–4 VAL_STOP_ SISG_COUNTER | SISG Stop Counters value. This is a predefined value that stops the SISG counters. The user should write to this field the N-1 value of the desired value. |
| 3–1 NO_VSYNC_2_ STRT_CNT | VSYCs to Start Counter This bits define how many VSYNCs signals will be counter before activating the SISG counters. If set to 0 starts immediately. If set to N (1..7) starts after N VSYNCs. |
| 0 VSYNC_RST_ CNT | VSYNC Resets counters Defines if the counters are stooped following VSYNC or when the counters reach a pre defined value (VAL_STOP_SISG_COUNTER) 1 The counters are stooped at VSYNC 0 The counters are stooped when the counters reach the VAL_STOP_SISG_COUNTER value. |

37.5.4 SISG Control 1 Register (IPUx_SISG_CTRL1)

Address: Base address + 8h offset

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------|----|----|----|----|----|---|-----------------|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | 0 | | | | | | | | | | | | | | | | SISG_OUT_POL | | | | 0 | | | SISG_STROBE_CNT | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

IPUx_SISG_CTRL1 field descriptions

| Field | Description |
|------------------------|---|
| 31–14 Reserved | This read-only field is reserved and always has the value 0. |
| 13–8 SISG_OUT_POL | SISG_OUT_POL This bits defines the polarity of the SISG output signals 1 active high 0 active low |
| 7–5 Reserved | This read-only field is reserved and always has the value 0. |
| 4–0 SISG_STROBE_CNT | SISG Strobe Count The SISG can repeat the sequence for up to 32 cycles; this is used for generating a train of pulses. |

37.5.5 SISG Set<i> Register (IPUx_SISG_SET_i)

Address: Base address + Ch offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| R | 0 | | | | | | | | SISG_SET_i | | | | | | | | | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

IPUx_SISG_SET_i field descriptions

| Field | Description |
|--------------------|--|
| 31–25 Reserved | This read-only field is reserved and always has the value 0. |
| 24–0 SISG_SET_i | SISG SET <i> value These bits define the set value of the SISG counter #<i> |

37.5.6 SISG Clear <i> Register (IPUx_SISG_CLR_i)

Address: Base address + 24h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|----|----|----|----|----|----|----|----|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| R | 0 | | | | | | | | SISG_CLEAR_i | | | | | | | | | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

IPUx_SISG_CLR_i field descriptions

| Field | Description |
|----------------------|--|
| 31–25 Reserved | This read-only field is reserved and always has the value 0. |
| 24–0 SISG_CLEAR_i | SISG CLR <i> value These bits define the clear value of the SISG counter #<i> |

37.5.7 Interrupt Control Register 1 (IPUx_INT_CTRL_1)

This register contains part of IPU interrupts controls. The controls of EOF (end of frame) of DMA Channels interrupts [31:0] can be found in this register.

Address: Base address + 3Ch offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|----------------|

IPUx_INT_CTRL_9 field descriptions

| Field | Description |
|--------------------|---|
| 31 CSI1_PUPE_EN | CSI1_PUPE_EN - CSI1 parameters update error interrupt enable. This bit enables an interrupt that is a result of an error generated by the CSI1. The error is generated in case where new frame arrived from the CSI1 before the completion of the CSI1's parameters update by the SRM 0 Interrupt is disabled. 1 Interrupt is enabled. |
| 30 CSI0_PUPE_EN | CSI0_PUPE_EN - CSI0 parameters update error interrupt enable. This bit enables an interrupt that is a result of an error generated by the CSI0. The error is generated in case where new frame arrived from the CSI0 before the completion of the CSI0's parameters update by the SRM 0 Interrupt is disabled. 1 Interrupt is enabled. |
| 29 Reserved | This read-only field is reserved and always has the value 0. |

Table continues on the next page...

IPUx_INT_CTRL_9 field descriptions (continued)

| Field | Description |
|---------------------------|---|
| 28 IC_VF_BUF_OVF_EN | This bit enables an interrupt that is a result of the IC Buffer overflow for view finder coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is disabled. 1 Interrupt is enabled. |
| 27 IC_ENC_BUF_OVF_EN | This bit enables an interrupt that is a result of the IC Buffer overflow for encoding coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is disabled. 1 Interrupt is enabled. |
| 26 IC_BAYER_BUF_OVF_EN | This bit enables an interrupt that is a result of the IC Buffer overflow for bayer coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is disabled. 1 Interrupt is enabled. |
| 25–1 Reserved | This read-only field is reserved and always has the value 0. |
| 0 VDI_FIFO1_OVF_EN | FIFO1 overflow Interrupt1 Enable The VDIC generates FIFO1 overflow interrupt1 when the write pointer of FIFO1 overruns read pointer. 0 Interrupt is disabled. 1 Interrupt is enabled. |

37.5.16 Interrupt Control Register 10 (IPUx_INT_CTRL_10)

This register contains part of IPU interrupts controls. This register controls error interrupt signals coming from different modules within

Address: Base address + 60h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

IPUx_SDMA_EVENT_1 field descriptions

| Field | Description |
|-----------------------------|---|
| 31 IDMAC_EOF_ SDMA_EN_31 | Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. n Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled. |
| 30 Reserved | This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled. |
| 29 IDMAC_EOF_ SDMA_EN_29 | Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. n Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled. |
| 28 IDMAC_EOF_ SDMA_EN_28 | Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. n Indicates the corresponding DMA channel number. |

| 0 Reserved | This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled. |

37.5.32 Shadow Registers Memory Priority 1 Register (IPUx_SRM_PRI1)

The register controls the priority of SRM updates. The priority level for each block that has a shadow of its registers in the SRM should be unique. The priority level defines the order of SRM updates. A block with priority set to 010 will be updated before a block with priority set to 001.

Address: Base address + A0h offset

IPUx_SRM_PRI2 field descriptions

| Field | Description |
|--------------------------|--|
| 31–29 Reserved | This read-only field is reserved and always has the value 0. |
| 28–27 DI1_SRM_MODE | DCI1 SRM Mode This field controls the SRM logic that handles the DI1 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the DI1 region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now |
| 26–24 DI1_SRM_PRI | DI1 SRM priority This bits define the priority of the DI1 module |
| 23–21 Reserved | This read-only field is reserved and always has the value 0. |
| 20–19 DIO_SRM_MCU_USE | DIO SRM is used by ARM platform This bit indicates that the registers of the DIO are currently being updated by the ARM platform. The ARM platform should set this bit before accessing the SRM part that is relevant to the DIO. The ARM platform should clear this bit when the update procedure is finished. When this bit is set the SRM mechanism will not update the DIO's registers to avoid data coherency problems. 1 DIO SRM is currently updated by the ARM platform 0 DIO SRM s currently not updated by the ARM platform |
| 18–16 DIO_SRM_PRI | DIO SRM priority This bits define the priority of the DIO module |

37.5.36 FSU Processing Flow 3 Register (IPUx_FS_PROC_FLOW3)

This register contains controls for IPU's tasks.

- Hide VPU_SUB_FRAME_SYNC for all versions
- Show VPU_SUB_FRAME_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.
- This requires some sophisticated conditional tag settings

IPUx_SKIP field descriptions

| Field | Description |
|-----------------------------|---|
| 31–20 VDI_SKIP | <p>VDI_SKIP</p> <p>These 12 bits define the skipping pattern of the frames send from the VDIC. The VDIC avoids reading fields from the memory if the output frame is skipped. Skipping is relevant only if the source to the VDIC is coming from the CSI. Skipping is done for a set of frames. The number of frames in a set is defined at VDI_MAX_RATIO_SKIP.</p> <p>when VDI_MAX_RATIO_SKIP = 1 => VDI_SKIP[1:0] is used; other bits are ignored</p> <p>when VDI_MAX_RATIO_SKIP = 2 => VDI_SKIP[2:0] are used; other bits are ignored</p> <p>..</p> <p>..</p> <p>when VDI_MAX_RATIO_SKIP = 11 => VDI_SKIP[11:0] are used;</p> |
| 19–16 VDI_MAX_RATIO_SKIP | Maximum Ratio Skip for VDIC |

Table continues on the next page...

IPUx_SKIP field descriptions (continued)

| Field | Description |
|----------------------------------|---|
| | These bits define the number of frames in a skipping set. The maximum value of this bits is 11. When set to 0 the skipping is disabled. |
| 15–11 CSI_SKIP_IC_VF | <p>CSI SKIP IC_VF</p> <p>These 5 bits define the skipping pattern of the frames send to the IC for view finder task from one of the CSIs as defined on the CSI_SEL and IC_INPUT bits Skipping is done for a set of frames. The number of frames in a set is defined at CSI_MAX_RATIO_SKIP_IC_VF.</p> <p>when CSI_MAX_RATIO_SKIP_IC_VF = 1 => CSI_SKIP_IC_VF[1:0] are used; other bits are ignored</p> <p>when CSI_MAX_RATIO_SKIP_IC_VF = 2 => CSI_SKIP_IC_VF[2:0] are used; other bits are ignored</p> <p>when CSI_MAX_RATIO_SKIP_IC_VF = 3 => CSI_SKIP_IC_VF[3:0] are used; other bits are ignored</p> <p>when CSI_MAX_RATIO_SKIP_IC_VF = 4 => CSI_SKIP_IC_VF[4:0] are used;</p> <p>Setting bit #n of CSI_SKIP_IC_VF means that the #n frame in the set is skipped.</p> <p>For example: if CSI_MAX_RATIO_SKIP_IC_VF = 4 and CSI_SKIP_IC_VF = 11010</p> <p>Frames #0 & Frame #2 will not be skipped as bit0 and bit2 are cleared</p> <p>Frames #1 & Frame #3 will be skipped as bit1 and bit3 are set</p> <p>bit #4 is ignored as CSI_MAX_RATIO_SKIP_IC_VF is set to 4</p> |
| 10–8 CSI_MAX_RATIO_SKIP_IC_VF | <p>CSI Maximum Ratio Skip for IC (view finder task)</p> <p>These bits define the number of frames in a skipping set. The maximum value of this bits is 4. When set to 0 the skipping is disabled.</p> |
| 7–3 CSI_SKIP_IC_ENC | <p>CSI SKIP IC_ENC</p> <p>These 5 bits define the skipping pattern of the frames send to the IC for encoding task from one of the CSIs as defined on the CSI_SEL and IC_INPUT bits Skipping is done for a set of frames. The number of frames in a set is defined at CSI_MAX_RATIO_SKIP_IC_ENC.</p> <p>when CSI_MAX_RATIO_SKIP_IC_ENC = 1 => CSI_SKIP_IC_ENC[1:0] are used; other bits are ignored</p> <p>when CSI_MAX_RATIO_SKIP_IC_ENC = 2 => CSI_SKIP_IC_ENC[2:0] are used; other bits are ignored</p> <p>when CSI_MAX_RATIO_SKIP_IC_ENC = 3 => CSI_SKIP_IC_ENC[3:0] are used; other bits are ignored</p> <p>when CSI_MAX_RATIO_SKIP_IC_ENC = 4 => CSI_SKIP_IC_ENC[4:0] are used;</p> <p>Setting bit #n of CSI_SKIP_IC_ENC means that the #n frame in the set is skipped.</p> <p>For example: if CSI_MAX_RATIO_SKIP_IC_ENC = 4 and CSI_SKIP_IC_ENC = 11010</p> <p>Frames #0 & Frame #2 will not be skipped as bit0 and bit2 are cleared</p> <p>Frames #1 & Frame #3 will be skipped as bit1 and bit3 are set</p> <p>bit #4 is ignored as CSI_MAX_RATIO_SKIP_IC_ENC is set to 4</p> |
| 2–0 CSI_MAX_RATIO_SKIP_IC_ENC | <p>CSI Maximum Ratio Skip for IC (encoding task)</p> <p>These bits define the number of frames in a skipping set. The maximum value of this bits is 4. When set to 0 the skipping is disabled.</p> |

37.5.40 Display General Control Register (IPUx_DISP_GEN)

This register controls various aspects of the display port.

Address: Base address + C4h offset

IPUx_DISP_GEN field descriptions

| Field | Description |
|-------------------|--|
| 31–26 Reserved | This read-only field is reserved and always has the value 0. |

Table continues on the next page...

IPUx_DISP_GEN field descriptions (continued)

| Field | Description |
|---------------------------|--|
| 25 DI1_COUNTER_RELEASE | DI1 Counter release By default the DI0 counters responsible for waveform generation for sync flow are frozen. For the first attempt to use the DI in sync flow the user should set this bit 1 counter is released and running 0 counter is cleared and stopped |
| 24 DI0_COUNTER_RELEASE | DI0 Counter release By default the DI0 counters responsible for waveform generation for sync flow are frozen. For the first attempt to use the DI in sync flow the user should set this bit 1 counter is released and running 0 counter is cleared and stopped |
| 23 CSI_VSYNC_DEST | CSI_VSYNC destination This bit defines the destination of the VSYNC coming from the CSI's 1 csi1_vsync is connected to DI0; csi0_vsync is connected to DI1 0 csi0_vsync is connected to DI0; csi1_vsync is connected to DI1 |
| 22 MCU_MAX_BURST_STOP | ARM platform Maximal burst This bit limit the maximal unspecified length burst. 1 The maximum unspecified burst length is 8-beat 0 The unspecified burst length is unlimited |
| 21–18 MCU_T | The address space for accesses through the AHB-lite slave port is MB and it is split internally (with 32MB resolution) according to bits [28:25] of the address. Using the following notation: Address = (ID[31:29], MSB[28:25], LSB[24:0]) The address is used as follows ("T" is a configurable integer between 0 and 13): MSB<T: access to an external device, with address = (MSB, LSB) T<=MSB<14: access to an external device, with address (MSB-T, LSB) |
| 17 MCU_DI_ID_9 | MCU_DI_ID_9 - DI ID via DC channel 9. This bit defines the DI that the ARM platform DC's access via channel #9 1 ARM platform accesses DC's channel #9 via DI1. 0 ARM platform accesses DC's channel #9 via DI0. |
| 16 MCU_DI_ID_8 | MCU_DI_ID_8 - DI ID via DC channel 8. This bit defines the DI that the ARM platform DC's access via channel #8 1 ARM platform accesses DC's channel #8 via DI1. 0 ARM platform accesses DC's channel #8 via DI0. |
| 15–7 Reserved | This read-only field is reserved and always has the value 0. |
| 6 DP_PIPE_CLR | DP Pipe Clear This bit clears the internal pipe of the DP. The user may use this bit in case of an error condition This is a self clear bit |

Table continues on the next page...

IPUx_DISP_GEN field descriptions (continued)

| Field | Description |
|---------------------------|--|
| | 1 Clear the internal pipe of the DP 0 Idle - does nothing |
| 5 DP_FG_EN_ASYNC1 | FG_EN - partial plane Enable for async flow 1. This bit enables the partial plane channel. 1 partial plane channel is enabled. 0 partial plane channel is disabled. |
| 4 DP_FG_EN_ASYNC0 | FG_EN - partial plane Enable for async flow 0. This bit enables the partial plane channel. 1 partial plane channel is enabled. 0 partial plane channel is disabled. |
| 3 DP_ASYNC_DOUBLE_FLOW | DP Async Double Flow. This bit define how many async flows are currently handles via DP channel (ch24+29) 1 2 flows are handled via DP 0 single flow is handled via DP |
| 2 DC2_DOUBLE_FLOW | DC2 Double Flow. This bit define how many flows are currently handles via DC2 channel (ch41) 1 2 flows are handled via DC2 0 single flow is handled via DC2 |
| 1 DI1_DUAL_MODE | DI1 dual mode control 1 DI1 operates in dual mode 0 DI1 is not in dual mode |
| 0 DI0_DUAL_MODE | DI0 dual mode control 1 DI0 operates in dual mode 0 DI0 is not in dual mode |

37.5.41 Display Alternate Flow Control Register 1 (IPUx_DISP_ALT1)

This register controls various aspects of the display port.

Address: Base address + C8h offset

| | | | | | | | | | | | | | | | | |
|-------|-----------------------|-------------------|----|----|-------------------|--------------------|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | sel_alt_0 | | | | step_repeat_alt_0 | | | | | | | | | | | |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

IPUx_DISP_ALT3 field descriptions

| Field | Description |
|--------------------|--|
| 31–28 sel_alt_1 | Select alternative parameters instead of DI Sync Wave Gen counter#. The DI is selected according to DP's synchronous channel destination |

Table continues on the next page...

IPUx_DISP_ALT3 field descriptions (continued)

| Field | Description |
|-----------------------------|---|
| | 0000 disable 0001 instead of counter 1 0010 instead of counter 2 1000 instead of counter 8 |
| 27–16 step_repeat_alt_1 | This field defines the amount of repetitions that will be performed by the counter |
| 15 cnt_auto_reload_alt_1 | Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the step_repeat_alt_0 field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the step_repeat_alt_0 field |
| 14–12 cnt_clr_sel_alt_1 | Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 Reserved 011 Reserved 100 Reserved 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on. |
| 11–0 run_value_m1_alt_1 | Counter pre defined value This field defines the counter pre defines value. real value- 1 |

37.5.44 Display Alternate Flow Control Register 4 (IPUx_DISP_ALT4)

This register controls various aspects of the display port.

Address: Base address + D4h offset

IPUx_DISP_ALT4 field descriptions

| Field | Description |
|----------------------------------|---|
| 31–19 Reserved | This read-only field is reserved and always has the value 0. |
| 18–16 run_resolution_alt_1 | Counter Run Resolution This field defines the trigger causing the counter to increment. The counter run resolution should be defined in the same way as in original DI's counter# |
| 15 Reserved | This read-only field is reserved and always has the value 0. |
| 14–12 offset_resolution_alt_1 | Counter offset Resolution This field defines the trigger causing the offset counter to increment The counter offset resolution should be defined in the same way as in original DI's counter# |
| 11–0 offset_value_alt_1 | Counter offset value The counter can start counting after a pre defined delay This field defines the amount of cycles that the counter will be delayed by |

37.5.45 Memory Reset Control Register (IPUx_MEM_RST)

This register controls the memory reset mechanism. IPU has a hardware mechanism for clearing the content of the internal memories. This allows the user to clear the content of or more of the internal memories without the need to perform write accesses to the memories.

Address: Base address + DCh offset

IPUx_MEM_RST field descriptions

| Field | Description |
|---------------------|---|
| 31 RST_MEM_START | Memory Reset Start Writing one to this bit activate the memory reset mechanism. The memories that their corresponding RST_MEM_EN bit is set will be cleared. When the memory reset mechanism completes the memory clearing procedure this bit will be automatically cleared. 1 The memory reset mechanism is activated and busy 0 Idle, the memory reset mechanism is not working. |
| 30–23 Reserved | This read-only field is reserved and always has the value 0. |
| 22–0 RST_MEM_EN | Reset Memory Enable Each bit on this field enables the memory reset mechanism for a specific memory. The user should set the relevant bits for the memories that need to be cleared. Below is the list of memories and their corresponding bit. srm = rst_mem_en[0] alpha = rst_mem_en[1] cpmem = rst_mem_en[2] |

Table continues on the next page...

IPUx_MEM_RST field descriptions (continued)

| Field | Description |
|-------|--|
| | tpm = rst_mem_en[3] mpm = rst_mem_en[4] bm = rst_mem_en[5] rm = rst_mem_en[6] dstm = rst_mem_en[7] dsom = rst_mem_en[8] lut0 = rst_mem_en[9] lut1 = rst_mem_en[10] ram_smfc = rst_mem_en[11] vdi_fifo2 = rst_mem_en[12] vdi_fifo3 = rst_mem_en[13] icb = rst_mem_en[14] vdi_fifo1 = rst_mem_en[15] dc_template = rst_mem_en[20] dmfc_rd = rst_mem_en[21] dmfc_wr = rst_mem_en[22] |

37.5.46 Power Modes Control Register (IPUx_PM)

This register controls the automatic transitions of the IPU between different power modes of the SoC and handles the clock change modes.

Address: Base address + E0h offset

IPUx_PM field descriptions

| Field | Description |
|---------------------------------|---|
| 31 LPSR_MODE | <p>LPSR Mode</p> <p>This bit indicates that the next attempt for entering low power mode is an attempt to move to LPST mode. Setting this bit by the user is essential in order to assure proper response of the IPU to the assertion of the stop request from the CCM.</p> <p>1 Next low power mode will be LPSR 0 Next low power mode is not LPSR</p> |
| 30 DI1_SRM_CLOCK_CHANGE_MODE | <p>SRM clock change mode</p> <p>When the clock is going to be changed to any new ratio other than 1:1, 1:2, 1:4. The user needs to prepare an alternate set of DI setting in the SRM.</p> <p>This bit enable this mode. This bit is self cleared.</p> <p>1 SRM clock change mode is enabled; the next clock change will be done by updating the DI settings from the SRM 0 SRM clock change mode is disabled.</p> |
| 29–23 DI1_CLK_PERIOD_1 | <p>DI1_CLK period option 1.</p> <p>This parameter defines the period of the clock that the DI1 works with. This parameter contains integer part (bits [6:4]) and fractional part (bits [3:0]).</p> <p>Setting this value to 1.0 (default) means that the DI1 works on the fastest possible clock.</p> <p>Setting a value smaller than 1.0 is not allowed.</p> |

37.5.52 Alternate Channel Triple Buffer Mode Select 0 Register (IPUx_ALT_CH_TRB_MODE_SEL0)

The register contains triple buffer mode select control information for 32 IPU's DMA channels.

When the channel is configured for triple buffer mode. The double buffer mode settings configured on the corresponding DB_MODE_SEL bit are overridden.

- Hide VPU_SUB_FRAME_SYNC for all versions
- Show VPU_SUB_FRAME_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.
- This requires some sophisticated conditional tag settings

IPUx_INT_STAT_15 field descriptions (continued)

| Field | Description |
|------------------------|---|
| 7 DP_ASF_BRAKE | DP Async Flow Brake indication interrupt. This bit indicates on the interrupt that is a result of the async flow brake at the DP 0 Interrupt is cleared. 1 Interrupt is requested. |
| 6 DP_SF_BRAKE | DP Sync Flow Brake indication interrupt. This bit indicates on the interrupt that is a result of the Sync flow brake at the DP 0 Interrupt is cleared. 1 Interrupt is requested. |
| 5 DP_ASF_END | DP Async Flow End indication interrupt. This bit indicates on the interrupt that is a result of the Async flow end at the DP 0 Interrupt is cleared. 1 Interrupt is requested. |
| 4 DP_ASF_START | DP Async Flow Start indication interrupt. This bit indicates on the interrupt that is a result of the Async flow start at the DP 0 Interrupt is cleared. 1 Interrupt is requested. |
| 3 DP_SF_END | DP Sync Flow End indication interrupt. This bit indicates on the interrupt that is a result of the Sync flow end at the DP 0 Interrupt is cleared. 1 Interrupt is requested. |
| 2 DP_SF_START | DP Sync Flow Start indication interrupt. This bit indicates on the interrupt that is a result of the Sync flow start at the DP 0 Interrupt is cleared. 1 Interrupt is requested. |
| 1 SNOOPING2_ INT | IPU snooping 2 event indication interrupt. This bit indicates on the interrupt that is a result of the detection of a snooping 2 signal assertion coming to the IPU 0 Interrupt is cleared. 1 Interrupt is requested. |
| 0 SNOOPING1_ INT | IPU snooping 1 event indication interrupt. This bit indicates on the interrupt that is a result of the detection of a snooping 1 signal assertion coming to the 0 Interrupt is cleared. 1 Interrupt is requested. |

37.5.68 Current Buffer Register 0 (IPUx_CUR_BUF_0)

This register contains the current buffer status information bit for each DMA channel.

Address: Base address + 23Ch offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

37.5.72 Shadow Registers Memory Status Register (IPUx_SRM_STAT)

The register contains status bits of SRM updates. There is a bit for each block. The bit is set when the SRM is currently updating the module's registers. When the SRM completes updating the registers of the block the bit is cleared. SW should not update the block's registers while it is being updated by the SRM.

Address: Base address + 24Ch offset

IPUx_SRM_STAT field descriptions

| Field | Description |
|--------------------|--|
| 31–10 Reserved | This read-only field is reserved and always has the value 0. |
| 9 DI1_SRM_STAT | DI1 SRM STAT This bit indicates that the SRM is currently updating the DI1 registers 1 SRM is busy updating the DI1 registers 0 SRM is not updating the DI1 registers |
| 8 DI0_SRM_STAT | DI0 SRM STAT This bit indicates that the SRM is currently updating the DI0 registers 1 SRM is busy updating the DI0 registers 0 SRM is not updating the DI0 registers |
| 7 CSI1_SRM_STAT | CSI1_SRM_STAT |
| 6 CSIO_SRM_STAT | CSIO_SRM_STAT |
| 5 DC_6_SRM_STAT | DC group #6 SRM STAT This bit indicates that the SRM is currently updating the DC group #6 registers |

Table continues on the next page...

37.5.75 Triple Current Buffer Register 0 (IPUx_TRIPLE_CUR_BUF_0)

This register contains the current buffer status information for triple buffer mode for each DMA channel.

- Hide VPU_SUB_FRAME_SYNC for all versions
- Show VPU_SUB_FRAME_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.
- This requires some sophisticated conditional tag settings

IPUx_IDMAC_CONF field descriptions

| Field | Description |
|--------------------------|--|
| 31–26 - | This field is reserved. Reserved, should be cleared. |
| 25 USED_BUFS_EN_R | Enables the limit on the number of pending non real time read requests. |
| 24–21 USED_BUFS_MAX_R | Limit the number of pending non real time read requests. The value can be between 0 to 8. This field has no affect if USED_BUFS_EN_R is cleared |
| 20 USED_BUFS_EN_W | Enables the limit on the number of pending non real time write requests. |

Table continues on the next page...

IPUx_IDMAC_CONF field descriptions (continued)

| Field | Description |
|------------------------------|--|
| 19–17 USED_BUFS_ MAX_W | Limit the number of pending non real time write requests. The value can be between 0 to 6. This field has no affect if USED_BUFS_EN_W is cleared |
| 16 P_ENDIAN | Pixel Endianness. The pixel Endianness must not be changed while any of the IDMAC channels is enabled. 0 little endian 1 Big endian |
| 15–6 - | This field is reserved. Reserved, should be cleared. |
| 5 RDI | Read Data Interleaving. This bit must match the slave read data interleaving support. If the AXI slave connected to the IPU supports read data interleaving then this bit must be set. If the AXI slave does not support read data interleaving then the IDMAC can utilize this and issue more address phases on read. In that case it is recommended to have this bit cleared. 0 The AXI slave does not support read data interleaving 1 The AXI slave supports read data interleaving |
| 4–3 WIDPT | Write Interleaving Depth These 2 bits define the Write Interleaving Depth of the AXI port. This bits should be configured by the user according to the AXI slave's Write Interleaving Depth. WIDPT defines the maximal number of active bursts (yet to be responded) with different IDs. IDMAC will block data phase if the next data's ID is new (no such ID active) and the number of active IDs is equal to WIDPT. 00 Write Interleaving Depth of 1 01 Write Interleaving Depth of 2 10 Write Interleaving Depth of 3 11 Write Interleaving Depth of 4 |
| 2–0 MAX_REQ_ READ | Maximum Read Requests. This fields sets the maximum pending requests allowed in the AXI Read requests queue. |

| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

IPUx_DP_GRAPH_WIND_CTRL_ASYNC1 field descriptions

| Field | Description |
|------------------------------|--|
| 31–24 DP_GWAV_ ASYNC1 | <p>GWAV - Graphic Window Alpha Value</p> <p>Defines the alpha value of graphic window used for alpha blending between graphic window and full plane. The Value the number that writing to GWAV register. The Actual Value the number, that insert to calculation in Combining Module. If Value = < 0.5- 1/256 (01111111) then Actual Value = Value. If Value >= 0.5 (10000000), then Actual Value = Value + 1/256.</p> <p>00000000 Actual value is 00000000; Graphic window totally opaque i.e. overlay on LCD screen</p> <p>01111111 Actual value is 01111111;</p> <p>10000000 Actual value is 10000001</p> <p>10000001 Actual value is 10000010</p> <p>11111110 Actual value is 11111111</p> <p>11111111 Actual value is 100000000;Graphic window totally transparent i.e. not displayed on LCD screen</p> |
| 23–16 DP_GWCKR_ ASYNC1 | <p>GWCKR - Graphic Window Color Keying Red Component</p> <p>Defines the red component of graphic window color keying.</p> <p>00000000 No red</p> <p>11111111 Full red</p> |
| 15–8 DP_GWCKG_ ASYNC1 | <p>GWCKG - Graphic Window Color Keying Green Component</p> <p>Defines the green component of graphic window color keying.</p> <p>00000000 No Green</p> <p>11111111 Full Green</p> |
| 7–0 DP_GWCKB_ ASYNC1 | <p>GWCKB - Graphic Window Color Keying Blue Component</p> <p>Defines the blue component of graphic window color keying.</p> <p>00000000 No blue</p> <p>11111111 Full blue</p> |

37.5.133 DP Debug Status Register (IPUx_DP_DEBUG_STAT)

Address: Base address + 1_80C0h offset

IPU Memory Map/Register Definition

IPUx_DP_DEBUG_STAT field descriptions

| Field | Description |
|-----------------------|---|
| 31–30 Reserved | This read-only field is reserved and always has the value 0. |
| 29 CYP_EN_OLD_1 | The async flow has been broken in the middle of a cursor (This filed is relevant for debug unit #1) |
| 28 COMBYP_EN_OLD_1 | the async1 flow has been broken in the middle of combining (This filed is relevant for debug unit #1) |
| 27 FG_ACTIVE_1 | Displaying the partial frame has been started (This filed is relevant for debug unit #1) |
| 26–16 V_CNT_OLD_1 | The exact row where the async flow has been broken (This filed is relevant for debug unit #0) |
| 15–14 Reserved | This read-only field is reserved and always has the value 0. |
| 13 CYP_EN_OLD_0 | The async flow has been broken in the middle of a cursor (This filed is relevant for debug unit #0) |
| 12 COMBYP_EN_OLD_0 | the async flow has been broken in the middle of combining (This filed is relevant for debug unit #0) |
| 11 FG_ACTIVE_0 | Displaying the partial frame has been started for async flow (This filed is relevant for debug unit #0) |
| 10–0 V_CNT_OLD_0 | The exact row where the async flow has been broken (This filed is relevant for debug unit #0) |

37.5.134 DP Partial Plane Window Position Async 1 Flow Register (IPUx_DP_FG_POS_ASYNC1)

The DP partial plane Window Position Register is used to determine the starting position of the partial plane window relative to BG window position.

This Register is used for the synchronous flow only.

Address: Base address + 1_80C4h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IPUx_IC_CONF field descriptions

| Field | Description |
|-----------------------|---|
| 31 CSI_MEM_WR_EN | CSI direct memory write enable. This bit enables writing data from sensor directly to memory even when a raw sensor is not attached. 0 CSI direct writing to memory is disabled. 1 CSI direct writing to memory is enabled. |
| 30 RWS_EN | Raw sensor enable. This bit indicate if a Raw sensor is attached (Bayer format). This bit is used together with the CSI_MEM_WR_EN bit as follows: CSI_MEM_WR_EN=0, RWS_EN=0 - data is fed from the CSI to the IC for processing; CSI_MEM_WR_EN=1, RWS_EN=0 - data is fed from the CSI to the IC for processing and also for writing to the system memory; CSI_MEM_WR_EN=0, RWS_EN=1 - data is fed from the CSI to the system memory (via the IC) and from the system memory to the IC for processing; CSI_MEM_WR_EN=1, RWS_EN=1 - non-valid configuration. 0 Raw sensor is not attached. 1 Raw sensor is attached. |
| 29 IC_KEY_COLOR_EN | Key Color enable. This bit enables the key color feature. |

Table continues on the next page...

IPUx_IC_CONF field descriptions (continued)

| Field | Description |
|--------------------|--|
| | 0 Key color is disabled. 1 Key color is enabled. |
| 28 IC_GLB_LOC_A | Global Alpha. This bit select the source of Alpha parameter. 0 Alpha parameter is local. 1 Alpha parameter is global. |
| 27–21 Reserved | This read-only field is reserved and always has the value 0. |
| 20 PP_ROT_EN | Post-Processing Rotation Task enable. This bit enable Post-Processing Rotation Task. 0 Rotation is disabled. 1 Rotation is enabled. |
| 19 PP_CMB | Post-Processing Task combining enable. This bit enables combining. 0 Combining is disabled. 1 Combining is enabled. |
| 18 PP_CSC2 | Post-Processing Task color conversion RGB-->YUV enable. This bit enables YUV-->RGB. Reserved 0 RGB-->YUV is disabled. 1 RGB-->YUV is enabled. |
| 17 PP_CSC1 | Post-Processing Task color conversion YUV-->RGB enable. This bit enables YUV-->RGB. 0 YUV-->RGB is disabled. 1 YUV-->RGB is enabled. |
| 16 PP_EN | Post-Processing Task enable. This bit enables the Post-Processing task. 0 Task is disabled. 1 Task is enabled. |
| 15–13 Reserved | This read-only field is reserved and always has the value 0. |
| 12 PRPVF_ROT_EN | Preprocessing Rotation Task for viewfinder enable. This bit enable Preprocessing Rotation Task for viewfinder. 0 Rotation is disabled. 1 Rotation is enabled. |
| 11 PRPVF_CMB | Preprocessing Task for View-Finder combining enable. This bit enables combining. 0 Combining is disabled. 1 Combining is enabled. |
| 10 PRPVF_CSC2 | Reserved |
| 9 PRPVF_CSC1 | Pre-processing task for view-finder first color conversion enable. This bit enables first color conversion. 0 First color conversion is disabled. 1 First color conversion is enabled. |
| 8 PRPVF_EN | Preprocessing Task for View-Finder enable. This bit enables the View-Finder task. |

Table continues on the next page...

IPUx_IC_CONF field descriptions (continued)

| Field | Description |
|--------------------|--|
| | 0 Task is disabled. 1 Task is enabled. |
| 7–3 Reserved | This read-only field is reserved and always has the value 0. |
| 2 PRPENC_ROT_EN | Preprocessing Rotation Task for encoding enable. This bit enable Preprocessing Rotation Task for encoding. 0 Rotation is disabled. 1 Rotation is enabled. |
| 1 PRPENC_CSC1 | Preprocessing Task for encoding color conversion enable. This bit enables color conversion. 0 Color conversion is disabled. 1 Color conversion is enabled. |
| 0 PRPENC_EN | Preprocessing Task for encoding enable. This bit enables the encoding task. 0 Task is disabled. 1 Task is enabled. |

37.5.143 IC Preprocessing Encoder Resizing Coefficients Register (IPUx_IC_PRP_ENC_RSC)

This register contains the resizing and downsizing parameters for Preprocessing task for encoding.

Address: Base address + 2_0004h offset

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IPUx_CSI0_SENS_CONF field descriptions

| Field | Description |
|--------------------------|--|
| 31 CSI0_DATA_EN_POL | Invert IPP_IND_SENSB_DATA_EN input. This bit selects the polarity of IPP_IND_SENSB_DATA_EN signal. 0 IPP_IND_SENSB_DATA_EN is directly applied to internal circuitry. 1 IPP_IND_SENSB_DATA_EN is inverted before applied to internal circuitry. |
| 30 Reserved | This read-only field is reserved and always has the value 0. |
| 29 CSI0_FORCE_EOF | Force End of frame This is a self clear bit allowing the user to force an End-of-frame event; This bit can be used in cases where the frame sent by the sensor was not completed. 1 force end of frame 0 no action |
| 28 CSI0_JPEG_MODE | JPEG Mode - this bit defines the mode of the control signals when working in JPEG mode 1 The data is valid as long as HSYNC and VSYNC signals are active; HSYNC is valid for single frame 0 The frame starts with the assertion of VSYNC. The frame ends on the next VSYNC or by setting the CSI0_FORCE_EOF bit. |
| 27 CSI0_JPEG8_EN | JPEG8 enable bit 1 JPEG8 detection is enabled 0 JPEG8 is disabled |
| 26–24 CSI0_DATA_DEST | These bits enable the destination of the data coming from the CSI. CSI0_DATA_DEST[0] - Reserved CSI0_DATA_DEST[1] - destination is IC CSI0_DATA_DEST[2] - destination is IDMAC via SMFC |
| 23–16 CSI0_DIV_RATIO | DIV Ratio Clock division ratio minus 1. This field defines the division ratio of HSP_CLK into SENSB_MCLK: $\text{SENSB_MCLK rate} = \text{HSP_CLK rate} / (\text{DIV_RATIO} + 1)$ |
| 15 CSI0_EXT_VSYNC | External VSYNC enable. This bits select between external and internal VSYNC. 0 Internal VSYNC mode. 1 External VSYNC mode. |
| 14–11 CSI0_DATA_WIDTH | Data width. This field defines the number of bits per color. Values: 0000 4 bits per color 0001 8 bits per color 0010 9 bits per color 0011 10 bits per color 0100 11 bits per color 0101 12 bits per color 0110 13 bits per color 0111 14 bits per color 1000 15 bits per color 1001 16 bits per color |

Table continues on the next page...

IPUx_CSI0_SENS_CONF field descriptions (continued)

| Field | Description |
|-----------------------------------|--|
| 10–8 CSI0_SENS_ DATA_FORMAT | <p>Data format from the sensor. This field defines the data format for the input of the CSI sensor.</p> <p>Values:</p> <p>000 full RGB or YUV444</p> <p>001 YUV422 (YUYV...)</p> <p>010 YUV422 (UYVY...)</p> <p>011 Bayer or Generic data</p> <p>100 RGB565</p> <p>101 RGB555</p> <p>110 RGB444</p> <p>111 JPEG</p> |
| 7 CSI0_PACK_ TIGHT | <p>CSI0 Pack Tight</p> <p>When the data format is YUV or RGB and the component's width is 9-16 bits, it can be sent to the memory in 2 different ways.</p> <p>1 Three 10 bits components are packed into a 32 bit word. Color extension/reduction is performed</p> <p>0 Each component is written as a 16 bit word where the MSB is written to bit #15, color extension is done for the remaining least significant bits.</p> |
| 6–4 CSI0_SENS_ PRTCL | <p>Sensor Protocol. This bit defines the Sensor timing/data mode protocol.</p> <p>Values:</p> <p>000 Gated clock mode</p> <p>001 Non-gated clock mode</p> <p>010 CCIR progressive mode (BT.656)</p> <p>011 CCIR interlaced mode (BT.656)</p> <p>100 CCIR progressive (BT.1120 DDR mode: data arrives on every edge of the clock)</p> <p>101 CCIR progressive (BT.1120 SDR mode: data arrives only on the positive edge of the clock)</p> <p>110 CCIR interlaced mode (BT.1120 DDR mode: data arrives on every edge of the clock)</p> <p>111 CCIR interlaced mode (BT.1120 SDR mode: data arrives only on the positive edge of the clock)</p> |
| 3 CSI0_SENS_ PIX_CLK_POL | <p>Invert Pixel clock input. This bit selects the polarity of pixel clock.</p> <p>0 pixel clock is directly applied to internal circuitry.</p> <p>1 pixel clock is inverted before applied to internal circuitry.</p> |
| 2 CSI0_DATA_ POL | <p>Invert data input. This bit selects the polarity of data input.</p> <p>0 data lines are directly applied to internal circuitry.</p> <p>1 data lines are inverted before applied to internal circuitry.</p> |
| 1 CSI0_HSYNC_ POL | <p>Invert IPP_IND_SENSB_HSYNC input. This bit selects the polarity of IPP_IND_SENSB_HSYNC signal.</p> <p>0 IPP_IND_SENSB_HSYNC is directly applied to internal circuitry.</p> <p>1 IPP_IND_SENSB_HSYNC is inverted before applied to internal circuitry.</p> |
| 0 CSI0_VSYNC_ POL | <p>Invert IPP_IND_SENSB_VSYNC input. This bit selects the polarity of IPP_IND_SENSB_VSYNC signal.</p> <p>0 IPP_IND_SENSB_VSYNC is not inverted before applied to internal circuitry.</p> <p>1 IPP_IND_SENSB_VSYNC is inverted before applied to internal circuitry.</p> |

37.5.153 CSI0 Sense Frame Size Register (IPUx_CSI0_SENS_FRM_SIZE)

IPUx_CSI0_ACT_FRM_SIZE field descriptions

| Field | Description |
|------------------------------|---|
| 31–28 Reserved | This read-only field is reserved and always has the value 0. |
| 27–16 CSI0_ACT_FRM_HEIGHT | Actual frame height minus 1. This field defines the CSI output frame rows number minus 1. |
| 15–13 Reserved | This read-only field is reserved and always has the value 0. |
| 12–0 CSI0_ACT_FRM_WIDTH | Actual frame width minus 1. This field defines the CSI output frame columns number minus 1. |

37.5.155 CSI0 Output Control Register (IPUx_CSI0_OUT_FRM_CTRL)

Address: Base address + 3_000Ch offset

IPUx_CSI0_OUT_FRM_CTRL field descriptions

| Field | Description |
|----------------------|--|
| 31 CSI0_HORZ_DWNS | Enable horizontal downsizing (decimation) by 2. 0 Downsizing disabled 1 Downsizing enabled |
| 30 CSI0_VERT_DWNS | Enable vertical downsizing (decimation) by 2. 0 Downsizing disabled 1 Downsizing enabled |
| 29 Reserved | This read-only field is reserved and always has the value 0. |
| 28–16 CSI0_HSC | Horizontal skip. This field defines the number of columns to skip. In Interlaced mode this number refers to the number of lines per field. |
| 15–12 Reserved | This read-only field is reserved and always has the value 0. |
| 11–0 CSI0_VSC | Vertical skip. This field defines the number of rows to skip. |

37.5.156 CSIO Test Control Register (IPUx_CSIO_TST_CTRL)

Address: Base address + 3_0010h offset

IPUx_CSIO_TST_CTRL field descriptions

| Field | Description |
|---------------------|--|
| 31–25 Reserved | This read-only field is reserved and always has the value 0. |
| 24 TEST_GEN_MODE | Test generator mode. This bit activates the signal generation. 0 Test signal generator is inactive. 1 Test signal generator is active. |
| 23–16 PG_B_VALUE | Pattern generator B value. This field selects the B value for the generated pattern of even pixel. |
| 15–8 PG_G_VALUE | Pattern generator G value. This field selects the G value for the generated pattern of even pixel. |
| 7–0 PG_R_VALUE | Pattern generator R value. This field selects the R value for the generated pattern of even pixel. |

37.5.157 CSIO CCIR Code Register 1 (IPUx_CSI0_CCIR_CODE_1)

Address: Base address + 3_0014h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | |
|-------|----|----|----|----|----|----|----|----------------------|----|----|---------------------|----|----|----|--------------------|----|--|

| Reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | |

IPUx_CSI0_DI field descriptions

| Field | Description |
|------------------------|---|
| 31–24 CSI0_MIPI_DI3 | CSI0_MIPI_DI3 This field holds the Data Identifier #3 handled by the CSI. |
| 23–16 CSI0_MIPI_DI2 | CSI0_MIPI_DI2 This field holds the Data Identifier #2 handled by the CSI. |
| 15–8 CSI0_MIPI_DI1 | CSI0_MIPI_DI1 This field holds the Data Identifier #1 handled by the CSI |
| 7–0 CSI0_MIPI_DI0 | CSI0_MIPI_DI0 This field holds the Data Identifier #0 handled by the CSI; This is the main stream. |

37.5.161 CSI0 SKIP Register (IPUx_CSI0_SKIP)

This register controls the frame skipping supported between CSI0 and the SMFC.

Address: Base address + 3_0024h offset

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | 0 | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----------------|---|----------------|---|---|---|---|--------------------------|---|---|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | 0 | | | | | | CSI0_ID_2_SKIP | | CSI0_SKIP_SMFC | | | | | CSI0_MAX_RATIO_SKIP_SMFC | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

IPUx_CSI0_SKIP field descriptions

| Field | Description |
|-----------------------|--|
| 31–10 Reserved | This read-only field is reserved and always has the value 0. |
| 9–8 CSI0_ID_2_SKIP | <p>CSI0 to SMFC Skipping ID.</p> <p>Data from the CSI0 to the SMFC has an ID associated with it. The ID is received from the MIPI interface. The skipping mechanism between the CSI0 and the SMFC can be used for only one ID. There is no skipping for data coming with ID different from the ID programed in this bits</p> <p>00 - Skipping mechanism is activated on frames with ID equal to 00 01 - Skipping mechanism is activated on frames with ID equal to 01 10 - Skipping mechanism is activated on frames with ID equal to 10 11 - Skipping mechanism is activated on frames with ID equal to 11</p> |
| 7–3 CSI0_SKIP_SMFC | <p>CSI0 SKIP SMFC</p> <p>These 5 bits define the skipping pattern of the frames send to the SMFC. Skipping is done for a set of frames. The number of frames in a set is defined at CSI0_MAX_RATIO_SKIP_SMFC.</p> <p>when CSI0_MAX_RATIO_SKIP_SMFC = 1 => CSI0_SKIP_SMFC[0] is used; other bits are ignored when CSI0_MAX_RATIO_SKIP_SMFC = 2 => CSI0_SKIP_SMFC[1:0] are used; other bits are ignored when CSI0_MAX_RATIO_SKIP_SMFC = 3 => CSI0_SKIP_SMFC[2:0] are used; other bits are ignored when CSI0_MAX_RATIO_SKIP_SMFC = 4 => CSI0_SKIP_SMFC[3:0] are used; other bits are ignored when CSI0_MAX_RATIO_SKIP_SMFC = 5 => CSI0_SKIP_SMFC[4:0] are used;</p> <p>Setting bit #n of CSI0_SKIP_SMFC means that the #n frame in the set is skipped.</p> <p>For example: if CSI0_MAX_RATIO_SKIP_SMFC = 4 and CSI0_SKIP_SMFC = 11010 Frames #0 & Frame #2 will not be skipped as bit0 and bit2 are cleared Frames #1 & Frame #3 will be skipped as bit1 and bit3 are set bit #4 is ignored as CSI0_MAX_RATIO_SKIP_SMFC is set to 4</p> |

Table continues on the next page...

IPUx_CSI0_SKIP field descriptions (continued)

| Field | Description |
|---------------------------------|--|
| 2–0 CSI0_MAX_RATIO_SKIP_SMFC | <p>CSI0 Maximum Ratio Skip for SMFC</p> <p>These bits define the number of frames in a skipping set.</p> <p>The skipping number is equal to CSI0_MAX_RATIO_SKIP_SMFC+1; The maximum value of this bits is 5. When set to 0 the skipping is disabled.</p> |

37.5.162 CSI0 Compander Control Register (IPUx_CSI0_CPD_CTRL)

Address: Base address + 3_0028h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

IPUx_CSI1_SENS_CONF field descriptions

| Field | Description |
|------------------------|--|
| 31 CSI0_DATA_EN_POL | Invert IPP_IND_SENSB_DATA_EN input. This bit selects the polarity of IPP_IND_SENSB_DATA_EN signal. 0 IPP_IND_SENSB_DATA_EN is directly applied to internal circuitry. 1 IPP_IND_SENSB_DATA_EN is inverted before applied to internal circuitry. |
| 30 Reserved | This read-only field is reserved and always has the value 0. |
| 29 CSI1_FORCE_EOF | Force End of frame This is a self clear bit allowing the user to force an End-of-frame event; This bit can be used in cases where the frame sent by the sensor was not completed. 1 force end of frame 0 no action |
| 28 CSI1_JPEG_MODE | JPEG Mode - this bit defines the mode of the control signals when working in JPEG mode 1 The data is valid as long as HSYNC and VSYNC signals are active; HSYNC is valid for single frame 0 The frame starts with the assertion of VSYNC. The frame ends on the next VSYNC or by setting the CSI0_FORCE_EOF bit |
| 27 CSI1_JPEG8_EN | JPEG8 enable bit 1 JPEG8 detection is enabled 0 JPEG8 is disabled |

Table continues on the next page...

IPUx_CSI1_SENS_CONF field descriptions (continued)

| Field | Description |
|-------------------------------|--|
| 26–24 CSI1_DATA_DEST | These bits enable the destination of the data coming from the CSI. CSI1_DATA_DEST[0] - Reserved CSI1_DATA_DEST[1] - destination is IC CSI1_DATA_DEST[2] - destination is IDMAC via SMFC |
| 23–16 CSI1_DIV_RATIO | DIV Ratio Clock division ratio minus 1. This field defines the division ratio of HSP_CLK into SENSB_MCLK: $\text{SENSB_MCLK rate} = \text{HSP_CLK rate} / (\text{DIV_RATIO} + 1)$ |
| 15 CSI1_EXT_VSYNC | External VSYNC enable. This bits select between external and internal VSYNC. 0 Internal VSYNC mode. 1 External VSYNC mode. |
| 14–11 CSI1_DATA_WIDTH | Data width. This fields defines the number of bits per color. Values: 0000 4 bits per color 0000 Reserved 0001 8 bits per color 0010 9 bits per color 0010 Reserved 0011 10 bits per color 0100 11 bits per color 0100 Reserved 0101 12 bits per color 0101 Reserved 0110 13 bits per color 0110 Reserved 0111 14 bits per color 0111 Reserved 1000 15 bits per color 1000 Reserved 1001 16 bits per color |
| 10–8 CSI1_SENS_DATA_FORMAT | Data format from the sensor. This field defines the data format for the input of the CSI sensor. Values: 000 full RGB or YUV444 001 YUV422 (YUYV...) 010 YUV422 (UYVY...) 011 Bayer or Generic data 100 RGB565 101 RGB555 110 RGB444 111 JPEG |
| 7 CSI1_PACK_TIGHT | CSI1 Pack Tight When the data format is YUV or RGB and the component's width is 9-16 bits, it can be sent to the memory in 2 different ways |

Table continues on the next page...

IPUx_CSI1_SENS_CONF field descriptions (continued)

| Field | Description |
|----------------------------|---|
| | 1 Three 10 bits components are packed into a 32 bit word. Color extension/reduction is performed 0 Each component is written as a 16 bit word where the MSB is written to bit #15, color extension is done for the remaining least significant bits. |
| 6–4 CSI1_SENS_PRTCL | Sensor Protocol. This bit defines the Sensor timing/data mode protocol. Values: 000 Gated clock mode 001 Non-gated clock mode 010 CCIR progressive mode (BT.656) 011 CCIR interlaced mode (BT.656) 100 CCIR progressive (BT.1120 DDR mode: data arrives on every edge of the clock) 101 CCIR progressive (BT.1120 SDR mode: data arrives only on the positive edge of the clock) 110 CCIR interlaced mode (BT.1120 DDR mode: data arrives on every edge of the clock) 111 CCIR interlaced mode (BT.1120 SDR mode: data arrives only on the positive edge of the clock) |
| 3 CSI1_SENS_PIX_CLK_POL | Invert Pixel clock input. This bit selects the polarity of pixel clock. 0 pixel clock is directly applied to internal circuitry. 1 pixel clock is inverted before applied to internal circuitry. |
| 2 CSI1_DATA_POL | Invert data input. This bit selects the polarity of data input. 0 data lines are directly applied to internal circuitry. 1 data lines are inverted before applied to internal circuitry. |
| 1 CSI1_HSYNC_POL | Invert IPP_IND_SENSB_HSYNC input. This bit selects the polarity of IPP_IND_SENSB_HSYNC signal. 0 IPP_IND_SENSB_HSYNC is directly applied to internal circuitry. 1 IPP_IND_SENSB_HSYNC is inverted before applied to internal circuitry. |
| 0 CSI1_VSYNC_POL | Invert IPP_IND_SENSB_VSYNC input. This bit selects the polarity of IPP_IND_SENSB_VSYNC signal. 0 IPP_IND_SENSB_VSYNC is not inverted before applied to internal circuitry. 1 IPP_IND_SENSB_VSYNC is inverted before applied to internal circuitry. |

37.5.174 CSI1 Sense Frame Size Register (IPUx_CSI1_SENS_FRM_SIZE)

Address: Base address + 3_8004h offset

IPUx_CSI1_OUT_FRM_CTRL field descriptions

| Field | Description |
|--------------------------|---|
| 31 CSI1_HORZ_ DWNS | Enable horizontal downsizing (decimation) by 2. 0 Downsizing disabled 1 Downsizing enabled |
| 30 CSI1_VERT_ DWNS | Enable vertical downsizing (decimation) by 2. 0 Downsizing disabled 1 Downsizing enabled |
| 29 Reserved | This read-only field is reserved and always has the value 0. |
| 28–16 CSI1_HSC | Horizontal skip. This field defines the number of columns to skip. In Interlaced mode this number refers to the number of lines per field |
| 15–12 Reserved | This read-only field is reserved and always has the value 0. |
| 11–0 CSI1_VSC | Vertical skip. This field defines the number of rows to skip. |

37.5.177 CSI1 Test Control Register (IPUx_CSI1_TST_CTRL)

Address: Base address + 3_8010h offset

IPUx_CSI1_TST_CTRL field descriptions

| Field | Description |
|---------------------|--|
| 31–25 Reserved | This read-only field is reserved and always has the value 0. |
| 24 TEST_GEN_MODE | Test generator mode. This bit activates the signal generation. 0 Test signal generator is inactive. 1 Test signal generator is active. |
| 23–16 PG_B_VALUE | Pattern generator B value. This field selects the B value for the generated pattern of even pixel. |
| 15–8 PG_G_VALUE | Pattern generator G value. This field selects the G value for the generated pattern of even pixel. |
| 7–0 PG_R_VALUE | Pattern generator R value. This field selects the R value for the generated pattern of even pixel. |

37.5.178 CSI1 CCIR Code Register 1 (IPUx_CSI1_CCIR_CODE_1)

Address: Base address + 3_8014h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31–24 CSI1_MIPI_DI3 | CSI1_MIPI_DI3 This field holds the Data Identifier #3 handled by the CSI. |
| 23–16 CSI1_MIPI_DI2 | CSI1_MIPI_DI2 This field holds the Data Identifier #2 handled by the CSI. |
| 15–8 CSI0_MIPI_DI1 | CSI1_MIPI_DI1 This field holds the Data Identifier #1 handled by the CSI |
| 7–0 CSI1_MIPI_DI0 | CSI1_MIPI_DI0 This field holds the Data Identifier #0 handled by the CSI; This is the main stream. |

37.5.182 CSI1 SKIP Register (IPUx_CSI1_SKIP)

This register control the frame skipping supported between CSI1 and the SMFC.

Address: Base address + 3_8024h offset

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | 0 | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----------------|---|----------------|---|---|---|---|--------------------------|---|---|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | 0 | | | | | | CSI1_ID_2_SKIP | | CSI1_SKIP_SMFC | | | | | CSI1_MAX_RATIO_SKIP_SMFC | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

IPUx_CSI1_SKIP field descriptions

| Field | Description |
|-----------------------|--|
| 31–10 Reserved | This read-only field is reserved and always has the value 0. |
| 9–8 CSI1_ID_2_SKIP | <p>CSI1 to SMFC Skipping ID.</p> <p>Data from the CSI1 to the SMFC has an ID associated with it. The ID is received from the MIPI interface. The skipping mechanism between the CSI1 and the SMFC can be used for only one ID. There is no skipping for data coming with ID different from the ID programed in this bits</p> <p>00 - Skipping mechanism is activated on frames with ID equal to 00 01 - Skipping mechanism is activated on frames with ID equal to 01 10 - Skipping mechanism is activated on frames with ID equal to 10 11 - Skipping mechanism is activated on frames with ID equal to 11</p> |
| 7–3 CSI1_SKIP_SMFC | <p>CSI1 SKIP SMFC</p> <p>These 5 bits define the skipping pattern of the frames send to the SMFC. Skipping is done for a set of frames. The number of frames in a set is defined at CSI1_MAX_RATIO_SKIP_SMFC.</p> <p>when CSI1_MAX_RATIO_SKIP_SMFC = 1 => CSI1_SKIP_SMFC[0] is used; other bits are ignored when CSI1_MAX_RATIO_SKIP_SMFC = 2 => CSI1_SKIP_SMFC[1:0] are used; other bits are ignored when CSI1_MAX_RATIO_SKIP_SMFC = 3 => CSI1_SKIP_SMFC[2:0] are used; other bits are ignored when CSI1_MAX_RATIO_SKIP_SMFC = 4 => CSI1_SKIP_SMFC[3:0] are used; other bits are ignored when CSI1_MAX_RATIO_SKIP_SMFC = 5 => CSI1_SKIP_SMFC[4:0] are used;</p> <p>Setting bit #n of CSI1_SKIP_SMFC means that the #n frame in the set is skipped.</p> <p>For example: if CSI1_MAX_RATIO_SKIP_SMFC = 4 and CSI1_SKIP_SMFC = 11010 Frames #0 & Frame #2 will not be skipped as bit0 and bit2 are cleared Frames #1 & Frame #3 will be skipped as bit1 and bit3 are set bit #4 is ignored as CSI1_MAX_RATIO_SKIP_SMFC is set to 4</p> |

Table continues on the next page...

IPUx_CSI1_SKIP field descriptions (continued)

| Field | Description |
|---------------------------------|--|
| 2–0 CSI1_MAX_RATIO_SKIP_SMFC | <p>CSI1 Maximum Ratio Skip for SMFC</p> <p>These bits define the number of frames in a skipping set. These bits define the number of frames in a skipping set. The skipping number is equal to CSI1_MAX_RATIO_SKIP_SMFC+1;</p> <p>The maximum value of this bits is 5. When set to 0 the skipping is disabled.</p> |

37.5.183 CSI1 Compander Control Register (IPUx_CSI1_CPD_CTRL)

IPUx_DIO_GENERAL field descriptions

| Field | Description |
|------------------------------|---|
| 31 di0_pin8_pin15_sel | This bit routes PIN8 over PIN15 1 PIN8 is routed to PIN15, PIN8 is also routed to PIN8 0 PIN15 is routed to PIN15, PIN8 is routed to PIN8 |
| 30–28 di0_disp_y_sel | DIO Display Vertical coordinate (Y) select. This field defines which one of the 8 counters will be used as a display's line counter. 000 counter #1 is selected 111 counter #8 is selected |
| 27–24 DIO_CLOCK_STOP_MODE | DI clock stop mode When performing a clock change. The DI stops the clock to the display. These field defines when the clock will be stopped. Stopping at EOL/EOF is supported for the case where the data is coming from the IDMAC (DMA access). In case that only direct accesses is performed, the user should set this field to 0000 0001-1001 stop at the next event of one of the counters (counter #1 to counter #9) 0000 stop at the next edge of the display clock 1100 stop at EOL (end of a line), but if stop request is during blanking interval, stop now 1101 stop at EOF (end of a frame), but if stop request is during blanking interval, stop now 1110 stop at EOL (end of a line), but if stop request is during blanking interval, stop at the end of the next line 1111 stop at EOF (end of a frame), but if stop request is during blanking interval, stop at the end of the next frame |

Table continues on the next page...

IPUx_DIO_GENERAL field descriptions (continued)

| Field | Description |
|-----------------------------|---|
| 23 DIO_DISP_CLOCK_INIT | Display clock's initial mode For synchronization error conditions the display clock can be stopped on the next VSYNC 1 The display's clock is running after the next VSYNC (indicating new frame) 0 The display's clock is stopped after the next VSYNC (indicating new frame) |
| 22 di0_mask_sel | DIO Mask select. IPP_PIN_2 output of the DI that functions as MASK signal can come from 2 sources: counter #2 or extracted from the MASK data coming from the memory. 1 IPP_PIN_2 is coming from extracted MASK data coming from the memory 0 IPP_PIN_2 is coming from counter #2 |
| 21 di0_vsync_ext | DIO External VSYNC. This bit selects the source of the VSYNC signal 1 External to the IPU 0 Internally generated by the IPU |
| 20 di0_clk_ext | DIO External Clock. This bit selects the source of the DIO's clock 1 The source of the clock is external to the IPU 0 The clock is internally generated by the IPU |
| 19–18 DIO_WATCHDOG_MODE | DIO watchdog mode In case of a display error where the DI clock is stopped (defined at di0_err_treatment). An internal watchdog counts DI clocks. If this timer reached its pre defined value the DI will skip the current frame and restart on the frame. This 2 bits define the number of DI clock cycles that the timer counts. 00 The timer counts 4 DI cycles 01 The timer counts 16 DI cycles 10 The timer counts 64 DI cycles 11 The timer counts 128 DI cycles |
| 17 di0_polarity_disp_clk | DIO Output Clock's polarity This bits define the polarity of the DIO's clock. 1 The output clock is active high 0 The output clock is active low |
| 16 Reserved | This read-only field is reserved and always has the value 0. |
| 15–12 di0_sync_count_sel | For synchronous flow error: selects synchronous flow synchronization counter in DI: |
| 11 di0_err_treatment | In case of synchronous flow error there are 2 ways to handle the display 1 to wait (stop clock) 0 Drive the last component |
| 10 di0_erm_vsync_sel | DIO error recovery block's VSYNC source select The error recovery block detect a case where the DI's VSYNC is asserted before the EOF. This bit selects the source of the VSYNC signal monitored by this mechanism. |

Table continues on the next page...

IPUx_DIO_GENERAL field descriptions (continued)

| Field | Description |
|-------------------------|--|
| | 1 vsync_post - an internal VSYNC signal asserted 2 lines after the DI's VSYNC 0 vsync_pre - an internal VSYNC signal asserted 2 lines before the DI's VSYNC |
| 9 di0_polarity_cs1 | DI0 Chip Select's 1 polarity This bits define the polarity of the DI's CS1. 1 The CS1 is active high 0 The CS1 is active low |
| 8 di0_polarity_cs0 | DI0 Chip Select's 0 polarity This bits define the polarity of the DI's CS0. 1 The CS0 is active high 0 The CS0 is active low |
| 7-0 di0_polarity_i_1 | DI0 output pin's polarity This bits define the polarity of each of the DI's outputs. 1 The output pin is active high 0 The output pin is active low |

37.5.195 DI0 Base Sync Clock Gen 0 Register (IPUx_DIO_BS_CLKGEN0)

Address: Base address + 4_0004h offset

IPUx_DIO_BS_CLKGEN0 field descriptions

| Field | Description |
|------------------------------|--|
| 31-25 Reserved | This read-only field is reserved and always has the value 0. |
| 24-16 di0_disp_clk_offset | DI0 Display Clock Offset The DI has the ability to delay the display's clock This field defines the amount of IPU's clock cycles added as delay on this clock. |
| 15-12 Reserved | This read-only field is reserved and always has the value 0. |
| 11-0 di0_disp_clk_period | DI0 Display Clock Period This field defines the Display interface clock period for display write access. This parameter contains an integer part (bits 11:4) and a fractional part (bits 3:0). It defines a fractional division ratio of the HSP_CLK clock for generation of the display's interface clock. |

37.5.196 DI0 Base Sync Clock Gen 1 Register (IPUx_DI0_BS_CLKGEN1)

Address: Base address + 4_0008h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IPUx_DI0_SYNC_AS_GEN field descriptions

| Field | Description |
|-------------------------|---|
| 31–29 Reserved | This read-only field is reserved and always has the value 0. |
| 28 di0_sync_start_en | di0_sync_start_en |
| 27–16 Reserved | This read-only field is reserved and always has the value 0. |
| 15–13 di0_vsync_sel | VSYNC select This field defines which of the counters functions as VSYNC signal 000 VSYNC is coming from counter #1 001 VSYNC is coming from counter #2 111 VSYNC is coming from counter #8 |
| 12 Reserved | This read-only field is reserved and always has the value 0. |
| 11–0 di0_sync_start | DI0 Sync start This field defines the number of low (including blanking rows) on the which the DI0 starts preparing the data for the next frame. |

37.5.216 DI0 Data Wave Gen <i> Register (IPUx_DI0_DW_GEN_i)

The DI0_DW_GEN_<i> register holds pointers for the waveform generators.

These registers have different bit arrangements for parallel and serial display. When using a parallel display [VDI Plane Size Register 4](#) is applicable. When using a serial interface [VDI Plane Size Register 4](#) is applicable.

Table 37-673. Register Field Descriptions for Serial Display

| Field | Description |
|--------------------------------|---|
| 31-24 di0_serial_period_<i> | DI0 Serial Period <i> This field defines the period of the time base serial display clock. The units are the internal DI clock |
| 23-16 di0_start_period_<i> | DI0 start period This field defines the amount of cycles between the point where the access is ready to be launched to the actual point where the time base serial display clock restarts. The units are the internal DI clock |

| R | 0 | | | | | | | | | | | | | | | | DIO_SCREEN_HEIGHT | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

IPUx_DIO_SCR_CONF field descriptions

| Field | Description |
|---------------------------|---|
| 31–12 Reserved | This read-only field is reserved and always has the value 0. |
| 11–0 DIO_SCREEN_HEIGHT | This field defines the number of display rows (Number_of_ROWS = DIO_SCREEN_HEIGHT+1) This field is used for VSYNC calculation and for anti-tearing |

37.5.229 DI0 Status Register (IPUx_DI0_STAT)

Address: Base address + 4_0174h offset

IPUx_DIO_STAT field descriptions

| Field | Description |
|------------------------------|--|
| 31–4 Reserved | This read-only field is reserved and always has the value 0. |
| 3 DIO_CNTR_ FIFO_FULL | This bit indicates a full state of the DI0 FIFO. This FIFO is part of the DI0 synchronizer. |
| 2 DIO_READ_ CNTR_EMPTY | This bit indicates an empty state of the DI0 FIFO. This FIFO is part of the DI0 synchronizer. |
| 1 DIO_READ_ FIFO_FULL | This bit indicates a full state of the DI0 FIFO when performing a read. This FIFO is part of the DI0 synchronizer. |
| 0 DIO_READ_ FIFO_EMPTY | This bit indicates an empty state of the DI0 FIFO when performing a read. This FIFO is part of the DI0 synchronizer. |

37.5.230 DI1General Register (IPUx_DI1_GENERAL)

Address: Base address + 4_8000h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

IPUx_DI1_GENERAL field descriptions

| Field | Description |
|------------------------------|--|
| 31 di1_pin8_pin15_sel | This bit routes PIN8 over PIN15 1 PIN8 is routed to PIN15, PIN8 is also routed to PIN8 0 PIN15 is routed to PIN15, PIN8 is routed to PIN8 |
| 30–28 di1_disp_y_sel | DI1 Display Vertical coordinate (Y) select. This field defines which one of the 8 counters will be used as a display's line counter. 000 counter #1 is selected 111 counter #8 is selected |
| 27–24 DI1_CLOCK_STOP_MODE | DI clock stop mode When performing a clock change. The DI stops the clock to the display. These field defines when the clock will be stopped Stopping at EOL/EOF is supported for the case where the data is coming from the IDMAC (DMA access). In case that only direct accesses is performed, the user should set this field to 0000 0001-1001 stop at the next event of one of the counters (counter #1 to counter #9) 0000 stop at the next edge of the display clock 1100 stop at EOL (end of a line), but if stop request is during blanking interval, stop now 1101 stop at EOF (end of a frame), but if stop request is during blanking interval, stop now 1110 stop at EOL (end of a line), but if stop request is during blanking interval, stop at the end of the next line 1111 stop at EOF (end of a frame), but if stop request is during blanking interval, stop at the end of the next frame |

Table continues on the next page...

IPUx_DI1_GENERAL field descriptions (continued)

| Field | Description |
|-----------------------------|---|
| 23 DI1_DISP_CLOCK_INIT | Display clock's initial mode For synchronization error conditions the display clock can be stopped on the next VSYNC 1 The display's clock is running after the next VSYNC (indicating new frame) 0 The display's clock is stopped after the next VSYNC (indicating new frame) |
| 22 di1_mask_sel | DI1 Mask select. IPP_PIN_2 output of the DI that functions as MASK signal can come from 2 sources: counter #2 or extracted from the MASK data coming from the memory. 1 IPP_PIN_2 is coming from extracted MASK data coming from the memory 0 IPP_PIN_2 is coming from counter #2 |
| 21 di1_vsync_ext | DI1 External VSYNC. This bit selects the source of the VSYNC signal 1 External to the IPU 0 Internally generated by the IPU |
| 20 di1_clk_ext | DI1 External Clock. This bit selects the source of the DI's clock 1 The source of the clock is external to the IPU 0 The clock is internally generated by the IPU |
| 19–18 DI1_WATCHDOG_MODE | DI1 watchdog mode In case of a display error where the DI clock is stopped (defined at di0_err_treatment). An internal watchdog counts DI clocks. If this timer reached its pre defined value the DI will skip the current frame and restart on the frame. This 2 bits define the number of DI clock cycles that the timer counts. 00 The timer counts 4 DI cycles 01 The timer counts 16 DI cycles 10 The timer counts 64 DI cycles 11 The timer counts 128 DI cycles |
| 17 di1_polarity_disp_clk | DI1 Output Clock's polarity This bits define the polarity of the DI's clock. 1 The output clock is active high 0 The output clock is active low |
| 16 Reserved | This read-only field is reserved and always has the value 0. |
| 15–12 di1_sync_count_sel | For synchronous flow error: selects synchronous flow synchronization counter in DI: |
| 11 di1_err_treatment | In case of synchronous flow error there are 2 ways to handle the display 1 to wait (i.e. stop clock) 0 Drive the last component |
| 10 di1_erm_vsync_sel | DI1 error recovery module's VSYNC source select The error recovery block detect a case where the DI's VSYNC is asserted before the EOF. This bit selects the source of the VSYNC signal monitored by this mechanism. |

Table continues on the next page...

IPUx_DI1_GENERAL field descriptions (continued)

| Field | Description |
|-------------------------|--|
| | 1 vsync_post - an internal VSYNC signal asserted 2 lines after the DI's VSYNC 0 vsync_pre - an internal VSYNC signal asserted 2 lines before the DI's VSYNC |
| 9 di1_polarity_cs1 | DI1 Chip Select's 1 polarity This bits define the polarity of the DI's CS1. 1 The CS1 is active high 0 The CS1 is active low |
| 8 di1_polarity_cs0 | DI1 Chip Select's 0 polarity This bits define the polarity of the DI's CS0. 1 The CS0 is active high 0 The CS0 is active low |
| 7-0 di1_polarity_i_1 | DI1 output pin's polarity This bits define the polarity of each of the DI's outputs. 1 The output pin is active high 0 The output pin is active low |

37.5.231 DI1 Base Sync Clock Gen 0 Register (IPUx_DI1_BS_CLKGEN0)

Address: Base address + 4_8004h offset

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IPUx_DI1_BS_CLKGEN0 field descriptions

| Field | Description |
|------------------------------|--|
| 31-25 Reserved | This read-only field is reserved and always has the value 0. |
| 24-16 di1_disp_clk_offset | DI1 Display Clock Offset The DI has the ability to delay the display's clock This field defines the amount of IPU's clock cycles added as delay on this clock. |
| 15-12 Reserved | This read-only field is reserved and always has the value 0. |
| 11-0 di1_disp_clk_period | DI1 Display Clock Period This field defines the Display interface clock period for display write access. This parameter contains an integer part (bits 11:4) and a fractional part (bits 3:0). It defines a fractional division ratio of the HSP_CLK clock for generation of the display's interface clock. |

37.5.232 DI1 Base Sync Clock Gen 1 Register (IPUx_DI1_BS_CLKGEN1)

Address: Base address + 4_8008h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IPUx_DI1_SYNC_AS_GEN field descriptions

| Field | Description |
|-------------------------|---|
| 31–29 - | Reserve |
| 28 di1_sync_start_en | di1_sync_start_en |
| 27–16 Reserved | This read-only field is reserved and always has the value 0. |
| 15–13 di1_vsync_sel | VSYNC select This field defines which of the counters functions as VSYNC signal 000 VSYNC is coming from counter #1 001 VSYNC is coming from counter #2 111 VSYNC is coming from counter #8 |
| 12 Reserved | This read-only field is reserved and always has the value 0. |
| 11–0 di1_sync_start | DI1 Sync start This field defines the number of low (including blanking rows) on the which the DI1 starts preparing the data for the next frame. |

37.5.252 DI1 Data Wave Gen <i> Register (IPUx_DI1_DW_GEN_i)

The DI1_DW_GEN_<i> register holds pointers for the waveform generators.

These registers have different bit arrangements for parallel and serial display. When using a parallel display [VDI Plane Size Register 4](#) is applicable. When using a serial interface [VDI Plane Size Register 4](#) is applicable.

Table 37-710. Register Field Descriptions for Serial display

| Field | Description |
|--------------------------------|--|
| 31-24 di1_serial_period_<i> | DI1 Serial Period <i> This field defines the period of the time base serial display clock. The units are the internal DI clock |
| 23-16 di1_start_period_<i> | DI1 start period This field defines the amount of cycles between the point where the access is ready to be launched to the actual point where the time base serial display clock restarts. The units are the internal DI clock. |

Table continues on the next page...

Table 37-710. Register Field Descriptions for Serial display (continued)

| Field | Description |
|----------------------------------|---|
| 15-14 di1_cst_<i> | DI1 Chip Select pointer for waveform <i> This field points to a register that defines the waveform of the CS pin. For serial displays the down value as defined on DI1_DW_SET*_<i> is measured from the assertion of the last serial display time base clock. 00 The waveform is defined according to the settings on DI1_DW_SET0_<i> 01 The waveform is defined according to the settings on DI1_DW_SET1_<i> 10 The waveform is defined according to the settings on DI1_DW_SET2_<i> 11 The waveform is defined according to the settings on DI1_DW_SET3_<i> |
| 13-9 | Reserved |
| 8-4 di1_serial_valid_bits_<i> | DI1 Serial valid bits. This field defines the amount of valid bits to be transmitted within the 32 bits internal word aligned to bit[0]. The actual amount of valid bits is di1_serial_valid_bits_<i> + 1 |
| 3-2 di1_serial_rs_<i> | DI1 Serial RS This field points to a register that defines the waveform of the RS pin. For serial displays the down value as defined on DI1_DW_SET*_<i> is measured from the assertion of the last serial display time base clock. 00 The waveform is defined according to the settings on DI1_DW_SET0_<i> 01 The waveform is defined according to the settings on DI1_DW_SET1_<i> 10 The waveform is defined according to the settings on DI1_DW_SET2_<i> 11 The waveform is defined according to the settings on DI1_DW_SET3_<i> |
| 1-0 di1_serial_clk_<i> | DI1 serial clock<i> This field points to a register that defines the waveform of the Serial clock pin. 00 The waveform is defined according to the settings on DI1_DW_SET0_<i> 01 The waveform is defined according to the settings on DI1_DW_SET1_<i> 10 The waveform is defined according to the settings on DI1_DW_SET2_<i> 11 The waveform is defined according to the settings on DI1_DW_SET3_<i> |

IPUx_DI1_SSC field descriptions

| Field | Description |
|---------------------|---|
| 31–24 Reserved | This read-only field is reserved and always has the value 0. |
| 23 DI1_PIN17_ERM | DI1 PIN17 error recovery mode. This bit defines the error recovery mode of the PIN17 pin. 1 The PIN17 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN17 pin following a display error detection. |

Table continues on the next page...

IPUx_DI1_SSC field descriptions (continued)

| Field | Description |
|---------------------|---|
| 22 DI1_PIN16_ERM | DI1 PIN16 error recovery mode. This bit defines the error recovery mode of the PIN16 pin. 1 The PIN16 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN16 pin following a display error detection. |
| 21 DI1_PIN15_ERM | DI1 PIN15 error recovery mode. This bit defines the error recovery mode of the PIN15 pin. 1 The PIN15 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN15 pin following a display error detection. |
| 20 DI1_PIN14_ERM | DI1 PIN14 error recovery mode. This bit defines the error recovery mode of the PIN14 pin. 1 The PIN14 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN14 pin following a display error detection. |
| 19 DI1_PIN13_ERM | DI1 PIN13 error recovery mode. This bit defines the error recovery mode of the PIN13 pin. 1 The PIN13 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN13 pin following a display error detection. |
| 18 DI1_PIN12_ERM | DI1 PIN12 error recovery mode. This bit defines the error recovery mode of the PIN12 pin. 1 The PIN12 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN12 pin following a display error detection. |
| 17 DI1_PIN11_ERM | DI1 PIN11 error recovery mode. This bit defines the error recovery mode of the PIN11 pin. 1 The PIN11 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN11 pin following a display error detection. |
| 16 DI1_CS_ERM | DI1 GLUELOGIC error recovery mode. This bit defines the error recovery mode of the GLUELOGIC. 1 The GLUELOGIC is release in case of a synchronous display error. The release will be done on the next VSYNC. 0 Nothing is done to the GLUELOGIC following a display error detection. |
| 15–6 Reserved | This read-only field is reserved and always has the value 0. |
| 5 DI1_WAIT_ON | Wait On This field defines the DC's response to WAIT signal |

Table continues on the next page...

IPUx_DI1_SSC field descriptions (continued)

| Field | Description |
|-------------------------------|--|
| | 1 The DC holds the flow as long as WAIT is asserted. 0 The DC continues the flow regardless the WAIT signal. |
| 4 DI1_BYTE_EN_ POLARITY | Byte Enable polarity This bit defines the polarity of the byte enable signals to the display. 1 active high. 0 active low. |
| 3 DI1_BYTE_EN_ RD_IN | Byte Enable Read In This bit selects the source of the byte enable pins 1 The write byte enable signals are routed via bits [17:16] of the display's data, The read byte enable signals are routed via bits [19:18] of the display's data 0 The byte enable signals are routed via bits [17:16] of the display's data for both read and write |
| 2-0 DI1_BYTE_EN_ PNTR | Byte Enable Pointer This pointer selects the pin asserted along with the byte enables signals 000 wave form of byte enable as pin_11 001 wave form of byte enable as pin_12 111 wave form of byte enable as suitable CS pin |

37.5.261 DI1 Polarity Register (IPUx_DI1_POL)

IPUx_DI1_POL field descriptions

| Field | Description |
|-------------------------------------|---|
| 31–27 Reserved | This read-only field is reserved and always has the value 0. |
| 26 DI1_WAIT_ POLARITY | WAIT polarity This bit defines the polarity of the wait signal input coming from the display 1 active high 0 active low |
| 25 DI1_CS1_BYTE_ EN_POLARITY | Byte Enable associated with CS1 polarity This bit defines the polarity of the byte enable signals to the display 1 active high 0 active low |
| 24 DI1_CS0_BYTE_ EN_POLARITY | Byte Enable associated with CS0 polarity This bit defines the polarity of the byte enable signals to the display 1 active high 0 active low |
| 23 DI1_CS1_DATA_ POLARITY | Data Polarity associated with CS1 |
| 22–16 di1_cs1_polarity | DI1 output pin's polarity for CS1 This bits define the polarity of each of the DI's outputs when CS1 is asserted 1 The output pin is active high 0 The output pin is active low |
| 15 DI1_CS0_DATA_ POLARITY | Data Polarity associated with CS0 |
| 14–8 di1_cs0_polarity | DI1 output pin's polarity for CS0 This bits define the polarity of each of the DI's outputs when CS0 is asserted 1 The output pin is active high 0 The output pin is active low |
| 7 DI1_DRDY_ DATA_ POLARITY | Data Polarity associated with DRDY |
| 6–0 di1_drdy_polarity | DI1 output dynamic pin's polarity for synchronous access This bits define the polarity of each of the DI's outputs when synchronous display access is asserted The pins' default polarity is the same as defined in the di0_drdy_polarity bits 1 The output pin is active high 0 The output pin is active low |

37.5.262 DI1Active Window 0 Register (IPUx_DI1_AW0)

Address: Base address + 4_8168h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

37.5.267 SMFC Watermark Control Register (IPUx_SMFC_WMC)

The purpose of this register is to control watermarks levels of DMA channels. The bit setting given relative to FIFO size and not in number of words since FIFO size depend from number of enabled DMA channels.

Address: Base address + 5_0004h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | | | | | | | | |

IPUx_SMFC_WMC field descriptions

| Field | Description |
|-------------------|--|
| 31–28 Reserved | This read-only field is reserved and always has the value 0. |
| 27–25 WM3_CLR | Watermark "clear" level of DMASMFC channel 3. 000 clear watermark level when FIFO is full on 1/8 of their size. 001 clear watermark level when FIFO is full on 2/8 of their size. 110 clear watermark level when FIFO is full on 7/8 of their size. 111 clear watermark level when FIFO is full. |
| 24–22 WM3_SET | Watermark "set" level of DMASMFC channel 3 000 set watermark level when FIFO is full on 1/8 of their size. 001 set watermark level when FIFO is full on 2/8 of their size. 110 set watermark level when FIFO is full on 7/8 of their size. 111 set watermark level when FIFO is full. |
| 21–19 WM2_CLR | Watermark "clear" level of DMASMFC channel 2. 000 clear watermark level when FIFO is full on 1/8 of their size. 001 clear watermark level when FIFO is full on 2/8 of their size. 110 clear watermark level when FIFO is full on 7/8 of their size. 111 clear watermark level when FIFO is full. |
| 18–16 WM2_SET | Watermark "set" level of DMASMFC channel 2. 000 set watermark level when FIFO is full on 1/8 of their size. 001 set watermark level when FIFO is full on 2/8 of their size. 110 set watermark level when FIFO is full on 7/8 of their size. 111 set watermark level when FIFO is full. |
| 15–12 Reserved | This read-only field is reserved and always has the value 0. |
| 11–9 WM1_CLR | Watermark "clear" level of DMASMFC channel 1. 000 clear watermark level when FIFO is full on 1/8 of their size. 001 clear watermark level when FIFO is full on 2/8 of their size. 110 clear watermark level when FIFO is full on 7/8 of their size. 111 clear watermark level when FIFO is full. |
| 8–6 WM1_SET | Watermark "set" level of DMASMFC channel 1. 000 set watermark level when FIFO is full on 1/8 of their size. 001 set watermark level when FIFO is full on 2/8 of their size. 110 set watermark level when FIFO is full on 7/8 of their size. 111 set watermark level when FIFO is full. |
| 5–3 WM0_CLR | Watermark "clear" level of DMASMFC channel 0. 000 clear watermark level when FIFO is full on 1/8 of their size. 001 clear watermark level when FIFO is full on 2/8 of their size. 110 clear watermark level when FIFO is full on 7/8 of their size. 111 clear watermark level when FIFO is full. |
| 2–0 WM0_SET | Watermark "set" level of DMASMFC channel 0. |

Table continues on the next page...

IPUx_SMFC_WMC field descriptions (continued)

| Field | Description |
|-------|---|
| 000 | set watermark level when FIFO is full on 1/8 of their size. |
| 001 | set watermark level when FIFO is full on 2/8 of their size. |
| 110 | set watermark level when FIFO is full on 7/8 of their size. |
| 111 | set watermark level when FIFO is full. |

37.5.268 SMFC Burst Size Register (IPUx_SMFC_BS)

This register holds the burst size value for each DMASMFCDMA channel. The burst size is the number of IDMAC's active accesses that will be done for each IDMAC's burst. This number is a function of PFS, BPP & NPB parameters in the IDMAC's CPMEM. These are the parameters corresponding to the IDMAC's channel used. The table below describes what should be the burst size according to PFS, BPP & NPB settings

Table 37-727. SMFC Burst Size

| BPP | PFS | BURST_SIZE |
|-----------|-----------|------------|
| 8 | 6 | NPB[6:4] |
| 16 | 6 | NPB[6:4] |
| All other | All other | NPB[6:2] |

Address: Base address + 5_0008h offset

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|----|----|----|-------------|----|---|---|-------------|---|---|---|-------------|---|---|---|
| R | 0 | | | | | | | | | | | | | | | | BURST3_SIZE | | | | BURST2_SIZE | | | | BURST1_SIZE | | | | BURST0_SIZE | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

IPUx_SMFC_BS field descriptions

| Field | Description |
|----------------------|--|
| 31–16 Reserved | This read-only field is reserved and always has the value 0. |
| 15–12 BURST3_SIZE | Burst Size of SMFCDMA channel 3. The value programmed here should be BURST_SIZE-1 (for example: for a burst size of 1, write 0 to these bits) |
| 11–8 BURST2_SIZE | Burst Size of SMFCDMA channel 2. The value programmed here should be BURST_SIZE-1 (for example: for a burst size of 1, write 0 to these bits) |
| 7–4 BURST1_SIZE | Burst Size of SMFCDMA channel 1. The value programmed here should be BURST_SIZE-1 (for example: for a burst size of 1, write 0 to these bits) |

Table continues on the next page...

IPUx_SMFC_BS field descriptions (continued)

| Field | Description |
|--------------------|---|
| 3–0 BURST0_SIZE | Burst Size of SMFCDMA channel 0. The value programed here should be BURST_SIZE-1 (for example: for a burst size of 1, write 0 to these bits) |

37.5.269 DC Read Channel Configuration Register (IPUx_DC_READ_CH_CONF)

Address: Base address + 5_8000h offset

| | | | | | | | | | | | | | | | | |
|-------|----------------|----|----|----|---------|---------|---------|---------|----|---------------------|----------|----|----------------|--------------|---------------|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R | TIME_OUT_VALUE | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | |
| Reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | 0 | | | | CS_ID_3 | CS_ID_2 | CS_ID_1 | CS_ID_0 | 0 | CHAN_MASK_DEFAULT_0 | W_SIZE_0 | | PROG_DISP_ID_0 | PROG_DI_ID_0 | RD_CHANNEL_EN | |
| W | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

IPUx_DC_READ_CH_CONF field descriptions

| Field | Description |
|-------------------------|--|
| 31–16 TIME_OUT_VALUE | Time out value. In case of a error during read accesses to the display, where no response from the display was received. A time-out counter will terminate the current access and perform the next commend defined in the microcode. This field defines the amount of the hsp_clk cycles counted before the time-out event is issued. This event is tied to the interrupt controller and can generate an error interrupt. |
| 15–12 Reserved | This read-only field is reserved and always has the value 0. |
| 11 CS_ID_3 | This bit maps an asynchronous display to a chip select 1 display #3 is connected to CS1 0 display #3 is connected to CS0 |
| 10 CS_ID_2 | This bit maps an asynchronous display to a chip select |

Table continues on the next page...

IPUx_DC_READ_CH_CONF field descriptions (continued)

| Field | Description |
|--------------------------|--|
| | 1 display #2 is connected to CS1 0 display #2 is connected to CS0 |
| 9 CS_ID_1 | This bit maps an asynchronous display to a chip select 1 display #1 is connected to CS1 0 display #1 is connected to CS0 |
| 8 CS_ID_0 | This bit maps an asynchronous display to a chip select 1 display #0 is connected to CS1 0 display #0 is connected to CS0 |
| 7 Reserved | This read-only field is reserved and always has the value 0. |
| 6 CHAN_MASK_DEFAULT_0 | Event mask bit for the read channel When more then one event is used during a flow (EOF, EOL, NL, NF, EOFIELD, etc.) masks all the event besides the event that is defined as the highest priority event 1 All the events are used - no mask 0 Only the highest priority event is used, the rest are masked |
| 5-4 W_SIZE_0 | Word Size The data coming from the IDMAC is 32bit wide. This field defines the size of the word used by the DC 00 8 bits are used - a 32 bit words includes 4X8bit valid words. 01 16 LSB bits - a 32 bit words includes 2 X16bit valid words. 10 24 MSB bits are used (RGB) - 8 LSB bits are ignored by the DC 11 32 bits are used |
| 3-2 PROG_DISP_ID_0 | The field defines which one of the 4 displays can be read. 00 display #0 01 display #1 10 display #2 11 display #3 |
| 1 PROG_DI_ID_0 | This bit select the DI which a read transaction can be performed through 1 DI #1 0 DI #0 |
| 0 RD_CHANNEL_EN | This bit enables the read channel. 1 The Read channel is enabled 0 The Read channel is disabled |

37.5.270 DC Read Channel Start Address Register (IPUx_DC_READ_SH_ADDR)

Address: Base address + 5_8004h offset

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R | 0 | | | ST_ADDR_0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| W | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

IPUx_DC_READ_SH_ADDR field descriptions

| Field | Description |
|-------------------|---|
| 31–29 Reserved | This read-only field is reserved and always has the value 0. |
| 28–0 ST_ADDR_0 | This field defines the start address within the display's memory space where the read transactions will be done from. |

37.5.271 DC Routine Link Register 0 Channel 0 (IPUx_DC_RL0_CH_0)

Address: Base address + 5_8008h offset

IPUx_DC_WR_CH_CONF_5 field descriptions

| Field | Description |
|----------------------------|---|
| 31–27 Reserved | This read-only field is reserved and always has the value 0. |
| 26–16 PROG_START_TIME_5 | This field defines the delay between display 's vertical synchronization pulse and the start time point of DC's channel 5 window. The delay is defined in pairs of rows. It is used for tearing elimination |

Table continues on the next page...

IPUx_DC_WR_CH_CONF_5 field descriptions (continued)

| Field | Description |
|--------------------------|---|
| 15-10 Reserved | This read-only field is reserved and always has the value 0. |
| 9 FIELD_MODE_5 | Field mode bit for channel #5 This bit defines if the channel works in field mode or frame mode; This bit is relevant if the flow is sync flow 1 Field mode 0 Frame mode |
| 8 CHAN_MASK_DEFAULT_5 | Event mask bit for channel #5 When more then one event is used during a flow (EOF, EOL, NL, NF, EOFIELD, etc.) masks all the event besides the event that is defined as the highest priority event 1 All the events are used - no mask 0 Only the highest priority event is used, the rest are masked |
| 7-5 PROG_CHAN_TYP_5 | This field define the mode of operation of channel #5 000 Disable 001 Reserved 010 Reserved 100 Normal mode without anti-tearing. For sync display this is the only mode allowed 101 Normal mode with anti-tearing 110 Reserved 111 Additional command channel is added to the flow handled by DC channel #5 |
| 4-3 PROG_DISP_ID_5 | The field defines which one of the 4 displays is associated with channel #5. 00 display #0 01 display #1 10 display #2 11 display #3 |
| 2 PROG_DI_ID_5 | This bit select the DI which a transaction associated with channel #5 can be performed to. When channel 28 is connected to DI0, channel 23 must be connected to DI1 even if ch23 is not used. This is done by writing 1 to this bit. 1 DI #1 0 DI #0 |
| 1-0 W_SIZE_5 | Word Size associated with channel #5 The data coming from the IDMAC is 32bit wide. This field defines the size of the word used by the DC 00 8 bits are used - a 32 bit words includes 4X8bit valid words. 01 16 LSB bits - a 32 bit words includes 2 X16bit valid words. 10 24 MSB bits are used (RGB) - 8 LSB bits are ignored by the DC 11 32 bits are used |

IPUx_DC_WR_CH_CONF1_9 field descriptions

| Field | Description |
|--------------------------|---|
| 31–5 Reserved | This read-only field is reserved and always has the value 0. |
| 4–3 MCU_DISP_ID_9 | The field defines which one of the 4 displays is associated with channel #9. 00 display #0 01 display #1 10 display #2 11 display #3 |
| 2 CHAN_MASK_DEFAULT_9 | Event mask bit for channel #9 When more then one event is used during a flow (EOF, EOL, NL, NF, EOFIELD, etc.) masks all the event besides the event that is defined as the highest priority event 1 All the events are used - no mask 0 Only the highest priority event is used, the rest are masked |
| 1–0 W_SIZE_9 | Word Size associated with channel #9 The data coming from the IDMAC is 32bit wide. This field defines the size of the word used by the DC 00 8 bits are used - a 32 bit words includes 4X8bit valid words. 01 16 LSB bits - a 32 bit words includes 2 X16bit valid words. 10 24 MSB bits are used (RGB) - 8 LSB bits are ignored by the DC 11 32 bits are used |

IPUx_DC_DISP_CONF1_0 field descriptions

| Field | Description |
|--------------------------|--|
| 31–8 Reserved | This read-only field is reserved and always has the value 0. |
| 7 DISP_RD_VALUE_PTR_0 | When the display works in wait for status mode. The IPU polls the display and compare the value to the value stored on the status DI_READ_DATA_ACK_VALUE and mask it with DI_READ_DATA_MASK. The DC holds 2 sets of mask and value. This field holds a pointer to the corresponding set of mask and value. 1 DI_READ_DATA_ACK_VALUE_1 & DI_READ_DATA_MASK_1 are used for display 0 0 DI_READ_DATA_ACK_VALUE_0 & DI_READ_DATA_MASK_0 are used for display 0 |
| 6 MCU_ACC_LB_MASK_0 | The DC compares between the current access to the a calculated address. The calculated address is the next consecutive address following the last address. This bit defines the comparing mode 1 The 2 addresses are fully compared 0 The 2 addresses are compared, but the ADDR[0] bit of the new address is ignored |
| 5–4 ADDR_BE_L_INC_0 | This bits define the increment mode when the latest access was done with some of the byte enable signals are low, in that case different increment should be done instead of the normal auto increment of the address IF MCU_ACC_LB_MASK_0 is 0 then only 00 and 10 values are allowed. 00 No increment 01 Increment by 1 10 Increment by 2 11 Increment by 3 |

Table continues on the next page...

IPUx_DC_DISP_CONF1_0 field descriptions (continued)

| Field | Description |
|-----------------------------|--|
| 3–2 ADDR_ INCREMENT_0 | This field is the increment step for auto increment mode 00 Increment the address by 1 01 Increment the address by 2 10 Increment the address by 3 11 Increment the address by 4 |
| 1–0 DISP_TYP_0 | This field defines the type of the display 00 Serial accesses display 01 Reserved 10 parallel display, without byte_enable support 11 parallel display, with byte_enable support |
